No. 1765

Champaign Public Library.

RULES.

No person shall be allowed to have out more than one volume at a time, which may be retained three weeks; and any person who shall retain a book from the Library beyond the time prescribed, shall pay to the Librarian a fine of ten cents for each week or a fraction of a week the Book is so kept; and if the Book is not returned at the end of six weeks from the time it was first taken out, the holder shall be liable to the Board for the retail price of the Book including the amount of fines imposed.

If any person shall lose or injure a Book he shall replace the same, or pay an equivalent in money, and if the Book lost or injured be one of a series, he shall make the series whole.

No person from whom any hire, fine or forfeiture is due, or who has damaged or lost any Book for which he has not paid, shall be permitted to have the use of the Library or Reading Room until satisfaction be made.

All Books shall be received of the Librarian and returned to him in person.

REPORT

OF THE

CHIEF SIGNAL OFFICER.

REPORT

OF THE

CHIEF SIGNAL OFFICER OF THE ARMY.

WAR DEPARTMENT,
OFFICE OF THE CHIEF SIGNAL OFFICER,
Washington, D. C., November 15, 1880.

SIR: The established course of drill and instruction in military signaling and telegraphy, meteorology and the Signal Service duties at stations of observation and report, together with the military drills, has continued at the school of instruction and practice at Fort Whipple, Va. The apparatus needed for the study and exercises, with instruments, for practice in the meteorological duties at stations of observation; the equipment for the drill in field signaling; the drill with the field telegraph train; the construction drill for permanent telegraph lines; and the duties on signal and telegraph stations is full and has been improved by useful additions. The duties at the post are conducted under strict military rule. The course at Fort Whipple is intended to furnish and maintain a force of enlisted men, selected after examination, disciplined as soldiers and fitted by special instruction for the special duties of the Signal Service.

Particular attention has been given in the year just passed to the drill of the force with arms and to such armed maneuvers as would be necessary for the corps in time of war. A rigorous practice of this kind is required for a force organized to act—armed, if need be—independently of other organizations, and to be capable of protecting with its own guard its own material and works.

Experiments in signaling and telegraphy are made at Fort Whipple under proper supervision. It is endeavored to keep up in all improvements with the progress made by scientific ingenuity in the special duties of the service, in the use of improved war material, and in the different modes of rapid communication now necessary and expected to be used, as of course, in war. With each ensuing year the duties of corps analogous in their service to the Signal Corps become more prominent, and hardly a month passes without some suggested improvement in telegraphic or signal apparatus, or in the methods of using them. Such are here tested as may have received the notice of this office, or to which attention is directed by higher authority. It is by following plans determined by tests had at this office and at Fort Whipple that the proper construction of the iron lines now so successfully used on the sea-coast and for the connection of posts, settlements, and stations on exposed frontiers and in the uninhabited interior has been arrived at.

The telegraphic line connecting Fort Whipple with this office, a field line, has been in constant use, different forms of telephones being employed upon it. Telephonic communication is adopted as the usual mode for all communications between this office and Fort Whipple.

The wires are so arranged and fitted with instruments that the ordinary modes of telegraphing may be used for any matters requiring to be of record. As a result of the experiments with telephones, telephonic communication has been established at points upon the sea-coast. Where connecting the life-saving stations, it has been used with fair success.

A series of experiments has been made with sun-flashes, with a view of improving upon the forms of heliograph to be adopted for the general uses of the Army, and it is believed that soon an improved heliograph will be adopted which combines great simplicity with efficiency. There have been other experiments, for which the post and the force stationed at it furnish, as they are intended to do, good facilities, as described in preceding reports.

The duties at this post are conducted under strict military rule. The post is controlled as connected with and as forming part of this office. The officers of the Signal Corps pass a course of drill and instruction, and serve regularly at this post, before being put upon any other duty of the Signal Service. It is recommended that all officers of the Army intended to be instructed as acting signal officers, or to be temporarily instructors in geographical military departments for the field duties of the Signal Service, be here instructed before being put upon detached duty. Instructors not themselves thoroughly instructed are worse than useless, and bring discredit on the Signal Service. It is aimed to furnish, by means of the thorough course of study and practice at Fort Whipple, a force of enlisted men, enlisted after examination, thoroughly disciplined as soldiers, and fitted by careful instruction for the special duties of the Signal Service.

The importance of the field duties of the Signal Service, and of the modes of communication such services make possible, are now recognized throughout the world. The modes of instruction in field or outdoor signaling, now nearly similar in the Army and Navy of the United States, ought to be made so absolutely, and a course so complete established that any force of either arm will be surely competent at any time to put itself in signal communication with any other force either of its own or of the other arm within signal distance. It is not necessary now to represent at length to any who have served in or read of recent wars, the propriety and the need that any armed force of any army should be able to telegraph or to communicate by other signals with any other of the same nationality or obeying the same general command.

The habitual practice of the duties of field signaling and telegraphy ought to become a part of the regular exercises adopted for the militia forces of the different States. To a small extent this practice has been already entered upon in some of the States.

The course of instruction at Fort Whipple for officers to be acting signal officers, and that for enlisted men, candidates for promotion to to the grade of sergeant in the Signal Corps or to the grades of first-class privates and corporals, are given herewith. (Paper 1.) They embrace such branches of study as experience has shown best suited to fit the pupil for the different positions of duty in which he may be placed. Papers 2 and 3 exhibit the names and number of officers instructed and the amount of field practice had by each.

During the year ending June 30, 1880, eight commissioned officers were under instruction, of whom five completed the full course in military signaling, telegraphy, and meteorology, and three are still under instruction.

Eighty-two enlisted men have been instructed for the position of assistants to observers. Of this number, fifty-nine completed the course of instruction, drill and practice, passed the necessary examination, and have been ordered to duty at stations as assistants. Two were discharged the service at their own request, three for cause upon the recommendation of the Chief Signal Officer, and eighteen are still under instruction. (Paper 4.)

One enlisted man has been instructed for promotion to the grade of sergeant, and four for promotion to the grade of corporal. Of these, four, successfully passing the examination, have been promoted and assigned to stations, and one is still under instruction. (Paper 5.)

The action of Congress, in permanently organizing the enlisted force of the Signal Corps and increasing its number, has imposed additional labor upon the instructor.

The habitual drills with arms, at the post of all the enlisted force stationed at the office of the Chief Signal Officer in Washington, in connection with the enlisted force at Fort Whipple, has continued during the year.

During the year ending June 30, 1880, First Lieut. R. P. Strong, acting signal officer, has remained in charge of the post.

The duties of instruction were under the immediate charge of First Lieut. F. C. Grugan, acting signal officer, until November 19, 1879, at which date he was relieved by First Lieut. B. H. Gilman, acting signal officer, who remains in charge, and performs in addition the duties of quartermaster and commissary of the post.

Acting Assistant Surgeon L. W. Ritchie was relieved from duty as post surgeon, March 20, 1880, and succeeded by Acting Assistant Surgeon Thomas E. Massey, who remains in charge. Dr. Ritchie had been on duty at the post continuously since September 23, 1869, and the records show that his duties were faithfully performed.

The storage capacity of the water supply of the post has been doubled by the erection of an additional tank holding ten thousand gallons.

A fire-engine is needed for the proper protection of the buildings and the valuable property stored at the post.

The number of men at Fort Whipple for duty has varied during the year from thirty-eight to sixty-two, and the number of officers from two to ten. The average number of enlisted men present during the year has been fifty-two.

The morning report of Fort Whipple, Va., for June 30, 1880, exhibits forty-eight enlisted men present for duty, of whom three were signal sergeants, two were corporals, forty-one privates, one commissary sergeant, and one hospital steward. Of this force one private was a candidate for promotion to the grade of corporal and twenty-six privates were under instruction for the position of assistant on station.

In preceding reports the Chief Signal Officer has expressed his conviction that the economy assured to the United States by the duties practiced at this post far exceeded the annual cost of maintaining it. Longer experience confirms this view.

As stated in that report, this post alone has made it practicable to put on station duty and in charge of stations those non-commissioned officers and men only who have been drilled, taught, tried, and so known to be fit for the labors and responsibilities to be required of them. There is no one of its varied duties but to which the force of the Signal Corps can be here habituated in practice before being brought to face the difficulties of its actual discharge. The benefits resulting from the school as one of practice, in which men are trained to be at once soldiers and students, have been apparent throughout the United States.

The enlisted men of the Signal Corps are engaged on duty as constant in time of peace as in the presence of actual war. The uses of the post at Fort Whipple for the discipline and instruction of the officers and enlisted men of the corps do not cease while either remain in the service. The force, made useful in time of peace by employment through which it is now admitted they return to the United States more than the cost of the service, is kept in readiness for any emergency of armed duty by regular drills, in which the officers and men stationed at this office and those whose changes of station bring them even temporarily within reach of Fort Whipple are there practiced and maneuvered as a part of accustomed duty. Men thus practiced are trained in discipline, and look upon events transpiring in their vicinity with soldierlike views.

The advantages of having distributed in the different cities of the United States a force of men with such training, habituated to acting in concert by order and promptly; capable of reporting simultaneously by telegraph and in cipher, as a duty, upon matters of military interest to which their attention may be directed, aside from the routine duties of their station, have been sufficiently evidenced. The self-possession of the non-commissioned officers in charge of stations, their prompt, concise, and reliable reports, rapidly collected over great extents of territory, for the information of superior authorities, in emergencies which have occurred, have received the warm commendation of officers high in rank. The rapid making of reports of this character and their transmission by telegraph, by aerial signals, or by other methods of communication, is the especial duty required in the service of the corps in time of war.

It is considered that the movements of the Army of the United States can be made by this agency as rapid on occasions of need as any of which there is record.

It is difficult to compute in money value the power of attaining such results. The advantages resulting to the War Department and to those especially charged with the management of the duties so varied and extensive as those of the Signal Service have become, from the knowledge that of all the force of the Signal Corps the course pursued leaves no man who, called upon for any duty of the service, would fail to be found fitted for it by careful instruction, are evident.

Meager reports only have been received of the instruction for the field duties of the Signal Service had elsewhere than at Fort Whipple.

In the Department of the Missouri, reports of instruction in field signaling have been received from Fort Bliss, Tex.; Fort Riley, Kans.; Fort Gibson, Ind. T., and Fort Union, N. Mex.; and in the Department of the East, from Fort Wayne, Mich.

The chief signal officer remains of the opinion that the general instruction of the Army in signaling and telegraphy, to be successfully carried on, should be confided only to officers who have themselves been carefully instructed, and who are responsible to the Chief Signal Officer for the discharge of their duties as instructors.

It is again recommended that provision be made that a force of six subaltern officers may be constantly under instruction at Fort Whipple, Va., in the duties of field signaling and telegraphy, it being understood that as each shall have completed the course and passed the necessary examination, he shall join his company and regiment; the number undertuition at the school of instruction to be kept constant by details to be made from companies and regiments not before instructed, as vacancies occur.

The legislation of the act approved June 16, 1880, increasing the enlisted force of the Signal Corps by fifty additional men, has been and will be productive of good results. This and previous legislation has fixed the service on an honorable footing, and opened a career, of which they are proud, to the best class of young American citizens. The applications for enlistment are numerous. The severe examinations are successfully undergone. The clause providing "that two sergeants may in each year be appointed to be second lieutenants," gives that stimulus of permanent service and promised reward so long and earnestly sought for. The success of this desired legislation is largely attributable to the steady and strong support of the Secretary of War.

Each year, however, since the passage of this act, additional duties not then contemplated have been imposed by Congress upon the corps.

The candidates for enlistment in the Signal Corps become year by year, as the service progresses and is approved, more numerously representative of the better educated classes of citizens.

The men to be enlisted are required to pass first a preliminary physical and educational examination before they are accepted for enlistment. After enlistment they are sent to Fort Whipple to be drilled and instructed. They are then tested by practice and further taught by a year of duty and study in the positions of assistants at stations. They are instructed later in higher branches at the school of instruction at Fort Whipple, and again examined and again tested by practice before being intrusted with the management of stations. They are held to a rigid observance of duty and with careful discipline at their several stations. The plan has furnished a force of soldiers of superior education and good character at the many stations throughout the United States. Their work is in evidence.

The work aggregating at this office has become each year more extensive. A field of operations actually coextensive with the northern hemisphere is now within its scope.

The details are many and complicated, each requiring to be elaborated for each day with the many checks necessary for accuracy, and each limited for its discharge to fixed and brief periods of time.

The organization of the service, improved by experience, has permitted each branch of duty to be carried on with regularity. The force on duty at this office, small in view of the onerous and extensive duties devolved upon it, has been at times, and necessarily, overworked.

The staff of the office since the date of the last annual report has been constituted as follows: First Lieuts. J. P. Story, H. H. C. Dunwoody, Robert Craig, C. E. Kilbourne, and H. W. Howgate, acting signal officers and assistants, who have been in charge, respectively, at different periods, of records, general correspondence, orders and enlistments; of the general charge of instruction, and general supervision of non-commissioned officers and assistants on station duty; the receipt, record, and publication of daily weather reports; and of the property division.

First Lieuts. J. P. Story, H. H. C. Dunwoody, Robert Craig, C. E. Kilbourne and A. W. Greely, acting signal officers, and Cleveland Abbe, A. M., have alternated, under the direction of the Chief Signal Officer, in immediate charge of the issue of cautionary signals, synopses, and indications, and the preparation of the publications of the office.

First Lieuts. J. P. Story, H. H. C. Dunwoody, J. McClellan, J. A. Buchanan, S. C. Vedder, C. A. Booth, and B. H. Gilman, and Second Lieut. C. A. Tingle, acting signal officers, and Second Lieuts. L. E. Sebree, J. S. Powell, and W. A. Glassford, Signal Corps, U. S. A., have been at different times attached to the office as inspectors.

The Chief Signal Officer refers with pleasure to the faithful services of these officers, as also of those serving at Fort Whipple and on detached duty elsewhere. The zeal and interest in the service manifested by the acting signal officers as a class, have won success in the duties with which they have been charged.

The aggregate of office correspondence has become very large, embracing many thousands of communications, exclusive of telegrams sent and received. The record is herewith. (Paper 6.) While the office work has increased in magnitude, it has not changed markedly in character since the date of the last annual report. As then stated, the office is in communication with numerous foreign correspondents, having now official relations with the scientific men and the chiefs of meteorological services of nearly every prominent power in the northern hemisphere. It has become the acknowledged center for meteorological information on the continent; it has succeeded in connecting itself with the meteorological work of the world. It maintains a system of exchanges valuable and interesting at once to those who send and who receive, more extensive, prompt, and regular than would have been possible for the service without the aid of military organization for its members and the incident power of regulation and control which accompanies it. Co-operation wherever sought has been cordial and courteous.

The preparation of statistics and reports upon special requests for the uses of individuals or institutions and journals which wish to publish data is a work of magnitude. The numerous applications for information on various subjects, many of them only indirectly connected with the duties of the office, require of themselves much attention. Requests for consolidated data or the discussion of meteorological facts, requiring in compliance days of labor, are made at times apparently without thought of how much has been asked for. It has been the rule of the office to furnish whatever has been in its power whenever it has been considered to be for the public benefit. (Paper 7.)

The work in the property division of the office is carefully systematized. It has become extensive with the increasing duties of the service. To meet, as it was hoped, the views of Congress, an economy almost parsimonious has been practiced. The shrinkage of values everywhere has permitted a reduction of outlays, without which the continuation of the work of the office in its present scope would, with the appropriations now available, have been impracticable. The management and the accounting for the sums appropriated for the official telegraphic lines of the United States, the uses of which are, by law, in part for commercial purposes, as well as for the special duties of this office, and for the conduct of military affairs, has become a work involving time, care and responsibility.

A number of useful maps and charts have been prepared in the map-room of the office. The work of this room, offering, as it does, in synoptic view, and at a glance, the results had from thousands of observations extended over years of labor, and condensed, after careful consideration, into the lines of the charting, becomes yearly, with the lapse of time, more valuable for the studies daily necessary. A glance at the chart exhibits to the student what else could be known only by the personal experience of years. It is desirable to increase the force employed and the work of the room, systematizing, in this way, the series of generalizations established by the duties of the service. A number of clerks are constantly employed in the computations necessary to fix these generalizations. On the success of this duty will rest much of the permanent advance to be hoped for.

Three hundred and four dollars and forty-five cents have been received during the year ending June 30, 1880, from the sale of maps and other office publications, in accordance with the act of Congress approved March 3, 1874, authorizing such sale.

The many inquiries received at this office as to the manner in which the publications of the office may be procured, indicate the want of a general knowledge of the fact that the sale of copies of any or all of its publications, or of any map or papers regularly issued by it, is authorized by law to be made to any applicant upon the payment of the actual cost to the United States of the paper or publication sought for. Valuable data of the office are always procurable in this way, for the study of any sufficiently interested in the subject to which the papers have reference, by paying the very moderate cost of paper and printing.

Nine hundred and twenty-seven meteorological instruments have been purchased for station use, and one thousand two hundred and fifty-six have been issued during the year ending June 30, 1880.

The artisans' work in the instrument and repair shop of the office has steadily increased in amount with the increased distribution of instruments and the number of stations. A number of meteorological instruments, made after original designs, have been here manufactured, to be tested in the office as to their value for practical use or for the purposes of distribution.

The practice of sending instruments by mail, in the charge of postal agents, under the special arrangement for this purpose made with the Postmaster-General, has continued to be successful, and is of material benefit to the office. The superintendent of the railway mail service and his assistants of the Post-Office Department, as well as the agents of that department generally, have rendered careful and energetic aid in this transportation. Such aid is important to a service now ramifying into every portion of the United States.

It is by the aid of the postal agents and the facilities had through them for the conveyance of instruments over their routes, that the wide distribution of meteorological apparatus, rendered necessary on seas and continents by the plans of observation and study now adopted, has become possible, and will be maintained.

A considerable number of instruments, anemometers, hygrometers, water-thermometers, rain-gauges, &c., have been issued to the Chief of the Bureau of Navigation of the Navy Department for use on vessels of the United States Navy in making, in co-operation with this office, the naval series of simultaneous observations directed by the honorable Secretary of the Navy in G. O. No. 220, dated December 25, 1876. This office supplies, upon proper application and receipt, any instruments required for this purpose. Reports of naval observations transmitted to this office are entered on the international bulletin and are charted upon the international weather charts.

A number of instruments have been furnished for temporary use on vessels of the commercial marine engaged in similar co-operation upon the marine series of observations.

The library of the office now contains four thousand four hundred and twenty-five bound volumes, and eight hundred and eighty-nine pamphlets, being an increase since the date of the last annual report of two hundred and seventy-six bound volumes and sixty-seven pamphlets. These works have been carefully catalogued and are filed for convenient reference. The list comprises an extensive collection for meteorological research, with other works, relating to the several duties of the service. Copies of some of the volumes are not to be found elsewhere, and are especially valuable. A number of important works have been obtained, without cost to the United States, from foreign societies and associations, in courteous exchange for the publications of this office.

The total number of stations of observation in operation June 30, 1880, within the territory of the United States, and maintained for the Signal Service, was two hundred and forty-seven, including those upon the telegraph lines in charge of this office, and the special river and sunset stations, from which reports are regularly received. Reports are also received from seventeen additional stations established by the authorities of the Dominion of Canada; also from one at St. John's, N. F., and one at York Factory, B. A. Telegraphic reports have been regularly received throughout the year from one, and mail reports from two, stations located in the West India Islands, and during a portion of the year telegraphic and mail reports from three others. The number of stations from which telegraphic reports are received at this office tri-daily is one hundred and forty-six; the number from which one telegraphic report only is received daily is thirty-four, and from which two telegraphic reports are received daily is one; making the total number of stations from which telegraphic reports are received daily one hundred and eighty-one.

The sums expended for the service secure for the United States not only the reports from the officially established stations, but incidentally those had from the additional stations, to which reference is made elsewhere.

The following is the record of regular stations for the year ending June 30, 1880:

ALBANY, NEW YORK.

[*Official number*, 16.]

Latitude	42° 40′
Longitude	73° 45′
Elevation of barometer above mean sea-level	75.26 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for six years	29.922
Mean annual barometer (reduced to sea-level) for six years	30.010
Mean annual temperature for six years	46°. 9
Mean annual rainfall for six years	39.78 inches.

Established December 22, 1873.

Office, No. 44 State street.

Sergeant S. W. Beall was in charge of the station until December 10, when he was relieved by Sergeant J. O. Barnes and ordered to Oswego, N. Y. Private G. E. Kelley has been on duty as assistant. Private G. A. Smith was assistant and telegraph operator from August 11 until March 25, when, owing to the removal of the office, his services were no longer required and he was ordered to this office.

The station was inspected in August, 1879, and in June, 1880. In both instances the office was found in excellent condition.

The Erie Canal closed November 25, and the Hudson River December 6, 1879. "Peoples" line of steamers began running on March 10. Erie Canal opened April 19.

The office was removed from a building on the grounds of the Dudley Observatory to its present location, No. 44 State street, March 15.

Extracts from the observer's semi-annual reports:

> The interest in the service is daily increasing; business men and students come to the office for information in reference to the operations of the service.
>
> The papers in this city deserve special mention for the interest manifested in the service, employés coming to the office daily to obtain information for publication.

PUBLICATIONS.

Number of Farmers' Bulletins issued during the year ending June 30, 1880	28,754
Number of Bulletins (manifold) issued during the year ending June 30, 1880	8,316
Number of Local Reports issued during the year ending June 30, 1880	980
Number of Forms 15 issued during the year ending June 30, 1880	622
Number of Forms 22 issued during the year ending June 30, 1880	132
Total	38,804

ALPENA, MICHIGAN.

[*Official number*, 85.]

Latitude	45° 5′
Longitude	83° 28′
Elevation of barometer above mean sea-level	608.25 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.325
Mean annual barometer (reduced to sea-level) for seven years	29.971
Mean annual temperature for seven years	42°. 0
Mean annual rainfall for seven years	35.78 inches.

Established September 10, 1872.

Office, corner Fletcher and Dock streets.

Sergeant J. A. Barwick has been in charge of this station throughout the year. On May 13 Private J. T. Foy was ordered from Milwaukee to assume temporary charge of the station, Sergeant Barwick having been ordered to Detroit for medical examination. On June 7 Sergeant Barwick returned and assumed charge. Private Foy then returned to Milwaukee. It was inspected in June and reported in a satisfactory condition.

Navigation closed at this port on December 10, 1879, and opened on March 23, 1880.

The display of cautionary signals was discontinued December 25, and resumed March 15.

Extracts from the observer's semi-annual reports:

The interest taken in the service at this point continues, the lumbermen and fishermen paying strict attention during the spring and fall to the cautionary signals.

Weekly and monthly weather reports have been furnished the Weekly Argus and Pioneer.

Forty-five cautionary signals were displayed during the year at this station.

Extracts from special reports of the observer relative to the display of cautionary signals:

September 3.—The mail steamer was detained two days by the storm, also several other vessels remained in harbor during display.

September 29.—Mail steamers delayed on account of heavy weather outside.

October 2.—No disasters reported; all vessels remained in port during display.

November 9.—No disasters reported; all sailing vessels remained in port during the display.

December 9.—Schooner L. C. Butts, towed into port in a leaking condition, having dragged her anchor and grounded near Thunder Bay Island at Nine-Mile Point.

Mean annual barometer (reduced to sea-level) for six years	30.043
Mean annual temperature for six years	51°. 6
Mean annual rainfall for six years	39.26 inches.

Established December 10, 1873.

Office, Apsley Cottage, Rhode Island avenue.

Sergeant E. W. McGann has been in charge during the year. Six assistants have been ordered to this station during the year and five transferred to other points. The station was inspected in March and found in good order.

The instrument shelter was moved from the ground to an office window, facing north, on April 8.

A summary of Form 22 is furnished and published by the Atlantic City Times, a weekly paper.

Cautionary signals and cautionary off-shore signals were displayed during the year at this station.

Extracts from special report of the observer relative to the display of cautionary signals:

> *July* 5.—Steamer G. W. Childs remained in port during the display.
>
> *July* 8.—Schooner Lydia B., Captain Sheppard, while entering the channel, was blown ashore on the inner bar.
>
> *July* 12.—All yachts remained in harbor until signal was lowered.
>
> *July* 26.—Two yachts cruising northward, observing the signal, put into port and remained during display.

August 16.—All vessels remained in harbor during the display. No disasters reported.

August 18 to 19.—Signals fully justified. In the northeastern part of the city houses were lifted from their foundation and others blown down. All the pleasure yachts were more or less injured; four were sunk and one blown to sea. Two small steamers were carried up on the meadows, but sustained only slight injury. Of the hundred bath-houses, not one is left standing and many have been carried to sea. In the city, many of the shade-trees were blown down, and the camp of Company E, N. G., of Philadelphia, was prostrated. The board walk which runs the entire length of the city along the beach was swept away. Schooner Flora Curtis of Perth Amboy, N. J., was driven ashore.

August 24.—The schooner Flora Curtis, which was driven ashore during gale of 18th, went to pieces. Signal gave timely warning of the approaching storm, consequently no casualties to report. All vessels remained in port.

October 10.—One fishing steamer and one schooner put into this port on account of the heavy weather. The Italian bark Antionetta Costa, from Genoa for New York, in ballast, went ashore on Brigantine Beach at 1.30 a. m. of the 11th.

November 18.—Two schooners put in, and, as soon as the signals were lowered, put to sea.

November 19.—Several schooners put in on account of the severe gale and remained during the display.

February 4.—Storm very severe; no vessels in port and no results reported.

February 16.—Thirteen fishing vessels put in and remained until signal was lowered.

February 24.—Two schooners put in night previous and went to sea at 7.30 a. m.

March 3.—One schooner put in and remained until the signals were lowered. No casualties.

March 9.—Very heavy weather reported at sea.

April 12.—One schooner put back upon observing signal and remained until it was lowered.

Established January 1, 1871.

Office, corner South and Water streets.

Sergeant William Black was relieved August 29, and Sergeant Robert Seyboth was assigned in charge September 27. Four assistants have been ordered to, and four relieved from, this station during the year.

Extracts from the observer's simi-annual reports:

The location of the office is central and convenient, as regards business interests, but not well adapted for the display of cautionary signals. The repetition of day signals at the Marine Observatory on Federal Hill does, however, considerably lessen this objectionable feature. Two large weather maps—one at the Corn and Flour Exchange, the other at the Merchants' Reading-Room—are changed daily, except Sundays, displaying the morning reports from seventy-two stations. Much interest is manifested in these maps, more especially by the members of the Corn Exchange. A very gratifying interest in the work of the service is manifested by all classes, the press included, which always has a kind word for the signal service.

Such of our business men as are more directly interested in the daily reports—as oyster-packers, pork-packers, and grain merchants—place the utmost reliance in them, and are largely governed by them in their daily business operations. The assistant who changes the large weather map at the Corn Exchange is usually surrounded by a large crowd of operators eagerly scanning each report as displayed. Frequent calls are also made at this office for information by business men, pleasure seekers, invalids, and sportsmen.

Vessel reports from Cape Henry are telephoned to the Merchants' Exchange or to the agents as soon as received, and are of very great advantage, especially in the case of the large ocean steamers, where a few hours of time gained in preparing for the arrival of emigrants and cargo are often equivalent to hundreds of dollars saved. Messrs. A. Schumaker & Co., agents for the Bremen and Allan Lines steamers, are very appreciative of the benefits thus received, and endeavor to make return for the same by urging their captains to furnish Marine Bulletins with all possible regularity.

The morning papers continue to publish full local reports, also midnight reports from the coast and from twenty northern and western stations. The American and News also publish weekly summaries in their Sunday issues. The Evening Herald and News publish local reports and the morning indications furnished through this office. Monthly summaries are published in full by all morning papers.

During the wheat harvest in June, when prices fluctuated according to the state of the weather in the West, and when a protracted corner in wheat existed, the anxiety to see the reports became very great, and many merchants called at this office daily before the exchange was open for business, and also to see the afternoon and midnight reports, which are not bulletined at the Exchange. The frequency which this office is called upon for the indications, in person or by telephone, proves that public faith in their reliability remains unshaken.

Eleven cautionary signals and six cautionary off-shore signals were displayed during the year at this station.

Extracts from special reports of the observer relative to the display of signals:

November 17.—High northwest winds were reported on Chesapeake Bay, although the signals were not justified at this port.

November 19.—Bay steamers arrived late and report heavy northwest gales and cold weather. Harbor very rough and tide unusually low. Steamer Mystic ashore and bilged near Queenstown. Several smaller vessels reported capsized or sunk in bay. The timely display of signals undoubtedly prevented many small crafts from leaving harbor.

March 23 to 25.—A brewery on the Frederick road was unroofed by the gale. The stove-pipe of the bark Governor lying in the stream was blown over, setting fire to the vessel and damaging her to the extent of $200. Extremely low tide in the harbor this morning, caused by continued northwesterly wind. Allan Line steamship grounded in mid-channel and remained fixed for the present.

April 11.—No marine disaster reported; some damage done to roofs and sign-boards in the city.

April 29 to 30.—Severe gale reported on the Chesapeake, compelling bay steamers to seek a harbor and delaying them. High tides on Maryland and Virginia shores, during which steamer Massachusetts was driven ashore in Dividing Creek.

Office, Life-saving station No. 17.

Private J. D. Marx has been in charge of this station during the year. One assistant has been relieved from, and one assigned to this station. It was inspected in March and found in good order.

Extracts from the observer's semi-annual reports:

During November and December this section of telegraph line was rebuilt and moved to a position of safety behind the sand hills.

Each day the telegraphic reports are sent to the central office, giving the number of vessels seen passing station during the day, and vessels seen displaying *signal letters* or otherwise recognizable are reported as soon as observed.

Sixty-one cautionary signals and thirty-nine cautionary off-shore signals were displayed during the year at this station.

Extracts from special reports relative to the display of signals:

October 18.—The sea ran very high and submerged the beach for several hundred yards, washing out the poles of the "Signal Service telegraph line," and carrying them completely away.

November 29.—One schooner anchored in the inlet and remained during display.

December 22.—Three sloops anchored in the inlet and remained during display.

February 2.—Ten schooners anchored in sight of station, remaining until signals were lowered.

February 3.—One schooner and one sloop anchored four miles off shore. Beach submerged.

February 9.—One schooner anchored off shore in sight of station during display.

February 13.—Two schooners anchored off shore in sight of station until signals were lowered.

February 19.—Three fishing schooners anchored near station during off-shore display.

March 16.—Brig Tropic, Capt. Joseph P. Otter, owner, ashore fourteen miles south of station at 3.30 a. m., fifteen days out with logwood, from Marigoner, Hayti, for New York; vessel full of water; crew of seven men landed by life-saving crew No. 21. Four schooners and three sloops anchored near station during off-shore display.

March 21.—Four schooners anchored near station.

March 25.—Five schooners and two sloops anchored near the mouth of Barnegat Inlet on the 24th, and remained until signals were lowered.

April 12.—Three schooners anchored near station.

April 17.—Seven schooners anchored near station.

Mean annual rainfall for nine years	50.82 inches.

Established November 1, 1870.

Office, Equitable Building, corner of Milk and Devonshire streets.

Sergeant B. M. Purssell has been in charge during the year. Three assistants have been ordered to, and two relieved from, this station. It was inspected in July, 1879, and in June, 1880, and was found in excellent order, and the work being properly performed. During the year six hundred and fifty-nine post-offices have been regularly supplied with the daily Farmers' Bulletin.

Extracts from the observer's semi-annual reports:

The Lowell Telephone Company, at the request of many of its patrons, is arranging to connect its central office in this city with the Signal Office. This will be an accommodation to a large number of people who now are required to visit the office when any special information is desired.

Constant demands are made at the Signal Office for more extended reports from other stations, especially from stations in the northwest and in the Southern States or cotton district. The reports received from other stations, together with the "Indications" and local records, are published without interruption in every paper in the city, except the Globe, which publishes the "Locals" and "Indications" daily. The past records of the service, both here and elsewhere, are daily brought into use by private parties, firms, corporations, and especially the courts, whose demands have at times been so frequent as to seriously interfere with the station duties. The records have frequently saved the city of Boston many dollars in the cases brought for damages by accidents from snow and ice in the streets. The records are also admitted as evidence in the United States courts.

The incidental and miscellaneous service rendered by this office is continually increasing, and consists in furnishing data from the local records, to be used in various ways, by physicians, civil engineers, and many others; also in furnishing information relative to the current telegraphic reports to many applicants daily.

The duty of dropping the Boston time-ball and attending to the batteries and instruments connected therewith has been performed with great care, but two failures having occurred during the six months.

The service is daily becoming more necessary to the public, and is cordially sustained by the press and public opinion. All extensions in the work of the service will find hearty support and encouragement from the people and press of New England.

A considerable number of masters of vessels sailing from Boston have been induced to aid in the marine work of the service, and are now making daily observations in many remote parts of both the Atlantic and Pacific.

In conclusion, I would state that all classes of citizens of every profession, occupation, or trade share in the benefits of the service, commend its usefulness, and testify to its value and the necessity of its continuance by liberal support from Congress.

Fifty-two cautionary signals and thirty cautionary off-shore signals were displayed at this station during the year.

Extracts from special reports relative to the display of signals:

July 8.—Many vessels remained in port; the wind blew a gale outside; no damages reported.

July 16.—The most severe storm since September, 1869. Life and property imperiled by the furious gale; trees denuded of branches or swept to the ground, windows broken, chimneys carried away and fences leveled, lives lost and vessels wrecked; five persons drowned by the capsizing of the yacht Myrtle. A boat containing two persons capsized and one drowned. Numerous other disasters reported. The loss of life by this storm now foots up a total of thirty persons.

August 18 to 19.—This was one of the most severe storms ever observed at this station, as the gale lasted over twelve hours and the wind blew in sudden gusts. Not a vessel left port during display.

October 10.—No vessel left, as the weather was very thick and threatening. No damage done.

October 19.—No vessels left port during the display. No damages reported.

October 24.—But few vessels left port during the display. No disasters reported.

October 29.—Gale severe and protracted; very few vessels left port during the display, and very little damage done on this immediate coast, but farther down the coast many vessels were wrecked.

November 3.—No vessel left port during the display; no damage reported.

November 16.—Only a few vessels left port during the display.

November 18 to 19.—No vessels left port during the display; no serious damage done owing to ample warning given the coasters; gale very severe, with heavy snow and rain.

November 20 to 22.—Gale severe and protracted; none but foreign vessels left port during the display; nearly all coasting vessels put into harbor in time to avoid the storm; no damage of importance caused by this gale owing to the timely warning.

November 29 to 30.—Very few vessels left port during the display.

December 22.—A number of vessels wrecked on the northeast coast.

January 30 to 31.—Gale very severe; no wrecks reported.

February 1 to 2.—Gale very severe; one schooner ashore.

February 3 to 4.—Gale exceedingly heavy and dangerous; many small disasters, none serious.

February 9.—A number of vessels sailed with the northwest wind; no wrecks or damages on this coast.

February 11 to 13.—A few vessels left port during the display; no damage on the New England coast.

February 13 to 14.—A few vessels sailed during latter part of display; one schooner went ashore at Nantucket shore; no lives lost.

February 20.—Gale very severe and protracted; no wrecks reported.

February 24.—No vessel sailed during display; no damages done on this coast.

March 6.—Gale very severe from off shore; but no damage done on this coast.

April 13.—Several vessels sailed during display. Bark Georgiana ashore at Chatham; gale very severe, from the southwest, on Cape Cod.

Established April 10, 1872.

Office, corner of Wisconsin avenue and Fifth street.

Private C. E. Truesdell was relieved from the charge of this station, March 10, 1880, by Sergeant H. Bessant. It has not been inspected during the year.

Extracts from the observer's semi-annual reports:

The newspapers publish a weekly report of the maximum, minimum, and mean temperatures, and the amount of rainfall.

A number of persons from the East have visited the office during the past six months, and all express themselves as highly pleased with the service and its predictions. Newspaper reports of the observations of rainfall and temperature at this station are attracting attention, being found useful to people arriving here with the intention of engaging in agriculture. Great interest is manifested in the service by the citizens, and all speak highly of its reports and forecasts.

Established November 1, 1870.

Office, No. 22 Weed's block.

Sergeant Orin Parker has been in charge during the year. Two assistants have been ordered to, and two relieved from, this station. The office has not been inspected during the year. Two hundred and eighty-two post-offices have been regularly supplied with the daily Farmers' Bulletins.

Navigation closed December 17, 1879, and opened March 19, 1880.

The display of cautionary signals was temporarily discontinued December 25, and resumed March 15.

Extracts from the observer's semi-annual reports:

It is gratifying to note increasing interest and faith manifested in the indications and cautionary signals. All classes are most certainly benefited thereby, but more especially navigators, roofers, farmers, gardeners, and the contractors on the government breakwater. Through the courtesy of the latter, telephonic communication has been established and maintained with the docks and other parts of the city, including all the daily newspaper offices. This has proved very advantageous in publishing storm warnings, and also to hundreds who have desired to obtain information, of every nature in regard to the weather, from this office.

This being the head of navigation on the Great Lakes, with enormous interests involved in the grain and other traffic, the importance of accurate storm warnings can scarcely be overestimated. It is a sufficient commentary on the past displays to state that they have been uniformly heeded by those interested. When the weather is expected to be fair, propellers frequently leave here towing two or more grain barges, all with very light or no loads at all, and therefore in imminent danger in even a moderate storm, because unmanageable in severe wind or high waves. It seems certain disasters would have occurred in many instances but for the timely warnings of approaching bad weather from the central office. The observer has been cited to appear with the records in several important cases. The records are received without question and as conclusive.

The display of cautionary signals has served as a guide to safety for vessels during a very stormy season.

The tug office is in telephonic communication with this office almost incessanty-during stormy weather, and through that office, which is in this way made heald quarters for the purpose, all latest telegrams and reports are instantly published to all interested. That no disaster of importance has occurred in this vicinity is acknowledged to have been due to the certain and prompt warnings which have been issued from the office of the Chief Signal Officer. Farmers' Bulletins have been issued, without failure, and distributed to designated persons and places, and have grown in public favor until now considered almost a necessity. They benefit particularly farmers and gardeners in planting, harvesting, and guarding from loss by frosts.

Forty-six cautionary signals were displayed during this year at the station.

Extracts from special reports relative to signals:

September 2 to 4.—Owing to the timely warning, no damages are reported.

October 29 to 30.—The office was visited almost hourly during the display by captains of vessels and others interested in shipping; the timely warning doubtless prevented many disasters, and was very favorably commended.

November 2 to 4.—Vessels driven back to harbor and reported severe winds; thick and threatening weather; no disasters reported.

November 24 to 25.—Nearly all of the vessels that left port yesterday were forced to put back, and report a terrific storm on the lake.

April 17.—Slight damages reported to several vessels; one seaman lost from schooner Miama Belle.

Mean annual barometer (reduced to sea-level) for eight years	29.979
Mean annual temperature for eight years	44°.8
Mean annual rainfall for eight years	29.70 inches.

Established May 24, 1871.

Office, Howard block, southwest corner Bank and Church streets.

Private J. H. Sherman was relieved from charge of this station July 1, 1879, by Sergeant G. C. Schaeffer. The station was inspected in August, 1879, and in June, 1880, and found in good order.

Extracts from the observer's semi-annual reports:

> The public have manifested much interest in the service, and the indications are consulted daily. The lumber merchants, especially, depend upon the official reports of the office when expecting barges from Canada.
>
> For the information of farmers in the State, reached by the newspapers, a tabulated report of the comparative temperature (daily mean thermometer for nine years) is made up once a week Much interest has been taken in this report.
>
> The office has been visited by persons from the city and points throughout the State, and also by those from other parts of the country, and no pains have been spared to make the service of interest and benefit.

Established June 1, 1871.

Office, United States custom-house, No. 71 Ohio levee.

Sergeant W. H. Ray has had charge of the station during the year. Private J. E. Miller was relieved from duty March 2, since which time there has been no assistant at the station.

The highest water in the river, 46 feet 7 inches, occurred March 21 to 23; lowest water, 2 feet 7 inches, October 9 and 10.

Extracts from the observer's semi-annual reports:

> Floating ice was observed on the Mississippi River on the 18th of December and continued up to the end of the year, navigation of river being obstructed by the heavy flow of ice from December 26 to January 1. The interest taken in the service, as manifested by the people in general, is highly gratifying. The persons who are most benefited by the reports are the river men and merchants engaged in the shipping business. I am also informed by the pork-packers and dealers in fresh fish, that they

are governed in their business transactions by a careful study of the weather bulletins as to probable changes to take place in the temperature, through which means the former know when to slaughter and the latter when to order a supply of fish. There has been a very noticeable increase of interest in the service during the past six months by all classes, and especially this can be said of our local physicians, who study the meteorological reports in connection with their professional duties.

Dr. John A. Rauch, of Chicago, who is secretary of the State board of health, called at this office upon numerous occasions during the yellow fever season, for the purpose of obtaining certain meteorological data which would aid him in regulating the quarantine, and I have it personally from that gentleman that he was entirely governed by the information deduced from the observations of the Signal Service, and he further stated that he had given the weather reports considerable study with beneficial results.

Mean annual barometer (reduced to sea-level) for five years	30.036
Mean annual temperature for five years	61°.2
Mean annual rainfall for five years	78.68 inches.

Established September 1, 1874.

Office, first floor of assistant light-house keeper's dwelling.

Private William Daly was in charge until March 5, 1880, when he was relieved by Private J. M. Wright. Two assistants were ordered to, and two relieved from, this station during the year. It was inspected in February, and the work found to be fairly performed.

Extracts from the observer's semi-annual reports:

All facts relating to disasters to vessels are promptly reported to the Chief Signal Officer over the coast telegraph line, and through information given in this way the owners of vessels are enabled to save much valuable property. The sea-faring community of Hatteras Inlet manifest considerable interest in the reports.

Seventy-eight cautionary signals and twenty-one cautionary off-shore signals were displayed during the year at this station.

The observer reports as follows relative to the display of signals:

August 15 to 19.—Flag-staff blown down and broken, anemometer cups blown off, schooners Water Lily and Southern Cross, both of Hatteras, driven ashore in the Pamlico Sound; the former cut away both masts to save vessel; schooner Ida B. Silsbee, of Patchogue, N. Y., sank in Hatteras Roads; residence blown down at Hatteras; coast line badly damaged.

January 25 to 28.—Schooner Moses Knowlton, of and for Baltimore, from Jamaica, cargo, fruit, struck on Hatteras Shoals and put into Hatteras Inlet leaking.

March 27 to 31.—Schooner Watchful bound from Newberne, N. C., to Philadelphia, cargo, shingles, was driven on shoals in Pamlico Sound, three miles northwest of Hatteras Inlet; no lives lost.

June 14 to 18.—A chimney and portions of framework blown from house occupied by principal keeper of Hatteras light; a grist-mill belonging to Capt. W. R. Jennett, together with a number of trees, blown over, the trees falling generally in the direction from which the wind blew; no further damage known.

Mean annual barometer (reduced to sea-level) for six years	30.044
Mean annual temperature for six years	58°.7
Mean annual rainfall for six years	56.66 inches.

Established December 15, 1873.

Office, new building, 150 feet east of light-house keeper's residence.

Sergeant J. H. Bokel was relieved October 10, for making false reports, and discharged the service. Sergeant D. Cuthbertson has been in charge since November 26. Six assistants have been ordered to, and five ordered from, this station during the year. The station was inspected in February and found in good order.

Extracts from the observer's semi-annual reports:

The reporting of vessels by telegraph to the central office is one of the important duties at this station, and no vessels, no matter how small, pass this station without being reported to the Chief Signal Officer at the earliest possible moment.

A large number of people visit this office in the summer. Not only American captains, but those of all other nations, take great interest in the display of signals, and I have heard them pronounce "the Signal Service of America the admiration of the world." Great benefit is derived from the telephone, as constant communication is kept between this office and life-saving stations Nos. 1, 2, 3, 4, and 5, so that in case of wrecks occurring between these points on the North Carolina coast word can be sent to this office and thence to the chief office in a few minutes. All vessels have been reported as soon as their distinguishing signal could be made out. Considerable difficulty is often experienced in making out signals on account of the thickness of the weather and the long distance of vessels from station.

Eighty cautionary signals and twenty-two cautionary off-shore signals were displayed at this station during the year.

The sergeant reports as follows relative to the display of signals:

August 18 to 19.—Anemometer cups blown off; maximum velocity estimated at 100 miles per hour at 12.45 p. m. of the 18th. Bark North Carolina ran ashore 9.45 a. m. 18th; crew of 17 all saved. American brig Northern Star in distress opposite station; telegraph line greatly damaged.

September 20 to 23.—Norwegian bark Stanley ran ashore half mile north of life-saving station No. 7; no cargo; no lives lost. Schooner Woodruff Sims wrecked off this station one mile south of life-saving station No. 2; crew saved; cargo, cordwood and oak plank; vessel and cargo a total loss.

November 17 to 21.—British steamship Rathmore, bound to London from Baltimore, encountered the storm shortly after passing this station on the 17th; her decks were swept and bulwarks blown away. Rowles, master, was killed by falling of rigging; she was obliged to return to port.

January 12 to 14.—This was a very severe storm. The warning was timely. A large number of vessels took shelter in Lynn Haven; sea very rough.

February 23 to 24.—This storm was very severe. A number of vessels returned to Norfolk upon seeing signal flying; no disasters.

March 23 to 25.—Gale most severe of the year; no damage reported.

March 29 to 31.—The most severe storm this year; no disasters reported.

May 21 to 22.—Warning in time and fully justified; no disasters reported.

June 14 to 17.—An ocean steamer came ashore near station, but got of without being damaged.

Established April 16, 1876.

Office, light-house keeper's dwelling.

Private H. J. Forman was in charge until January 19, when he was transferred to the central office; Private R. Graham from January 19 to March 6, and Private T. J. Kenan from March 6 to date. There is one assistant at this station. It was inspected in February and found in fair condition.

Extract from the observer's semi-annual report:

The fishermen on the beach derive great benefit from the service.

Sixty-four cautionary signals and sixteen cautionary off-shore signals were displayed during the year at this station.

The observer reports as follows relative to display of signals:

August 15 to 18.—Halliards broken and signal lantern blown away. Estimated velocity 160 miles per hour; last velocity recorded by self-registering anemometer was 138 miles per hour. Houses blown down, trees twisted off and uprooted. A schooner and several boats carried in shore, turned over, dashed to the ground and demolished. Ten miles of telegraph line prostrated; 50 yards of Shackelford's Point washed away; cable broken in two places; potato and corn crops ruined.

December 11 to 16.—Ship Jacob Trumpy ashore 25 miles north of station and a total loss.

January 13 and 14.—Anemometer cups broken off.

April 13 to 17.—Survey steamer Endeavor made harbor in Hook during storm.

June 14 to 18.—One schooner anchored in Hook during gale.

Established May 24, 1871.

Office, Block A, lot 27, Beach avenue, Cape May Point.

Corporal John R. Williams was in charge of this station until February 19, when he was relieved by Corporal J. J. Fitzgerald and ordered elsewhere. Three assistants have been ordered to, and three relieved from, this station during the year. There is now no assistant at the station. It was inspected in March and found in good order.

On January 31 this station was discontinued as a full reporting station. Since that time but three daily observations have been taken, none of which are forwarded by telegraph.

Extracts from the observer's semi-annual reports:

> The benefits derived from the display of cautionary signals at this station cannot well be ascertained. The large percentage of justification and the large number of vessels passing within observing distance must undoubtedly render them valuable. All vessel and wreck reports have been forwarded promptly by telegraph to the central office. The office is visited daily by merchants, business men, and seafaring men, and the public interest taken in the service remains unabated.
>
> Seventy-two cautionary signals and forty-eight cautionary off-shore signals were displayed during the year at this station.

Private J. H. Melton was in charge until April 10, when he was relieved by Private F. W. Mixer and ordered to this office. There is no assistant at this station. The station was inspected in February and found in good order.

Under date of October 30, 1879, the station at Saint Mark's, Fla., was ordered discontinued and transferred to Cedar Keys, Fla. Station was opened here on the 7th of November, 1879, only partial reports being taken until November 15, when full reports were commenced. The office is pleasantly located and conveniently arranged.

Extracts from the observer's semi-annual reports:

> The citizens manifest much interest in the service and have expressed their gratification at having the station established here. Frequent inquiries are made by shippers and dealers in fruit in regard to the weather, and "Indications" for the East Gulf States would be highly appreciated could they be displayed at this station.
>
> Seven cautionary signals were displayed during the year at this station.

The observer reports as follows relative to the display of signals:

> *January* 26.—One steamer remained in port during the display; no damages reported.
>
> *February* 2.—Storm was quite severe; carried away part of rigging and rudder of schooner Ruby; very high tide during display.
>
> *March* 27.—Severe gale; very rough weather at sea reported.

Established January 5, 1871.

Office, corner of East Bay and Broad streets.

Sergeant W. A. Chapman was relieved from charge of this station July 26, and Private J. H. Walter placed temporarily in charge. On August 23 Sergeant J. H. Smith was ordered to assume charge of the station. There has been no change in the assistant. The station was inspected in November, and found in good order.

Extracts from the observer's semi-annual reports:

The interest in the service at this port has not diminished, but appears to be gradually on the increase. Captains and vessel owners, rice and cotton planters, brokers and factors are about the only class of people at this place who are directly benefited by the reports. Mariners place explicit confidence in the storm warnings, and rarely leave port while signals are displayed without calling or sending to the office for information in regard to the nature of the disturbance and prevailing weather along the coast.

The operations of the service are highly appreciated by all classes, and the interest heretofore reported remains unabated.

Eleven cautionary signals and one cautionary off-shore signal were displayed during the year at this station.

Office, Traders' National Bank building, northeast corner of Tryon and Trade streets.

Sergeant D. O'Donohue has been in charge during the year. He has no assistant. The station was inspected in February.

Extracts from the observer's semi-annual reports:

The local paper publishes the afternoon bulletin and the local observations in the next day's issue. It also publishes the summary of Form 22, monthly, and other meteorological data of interest, such as unusual rainfalls, winds, &c. Increased interest is manifested in the daily reports. During the past six months frequent inquiries have been made at this office as to the probable character of the weather by pic-nic parties, persons going into the country, &c.; and the indications furnished were in every instance verified. The more intelligent classes place the greatest reliance upon the weather reports.

Established November 1, 1870.

Office, Major Block, southeast corner Madison and La Salle streets.

Sergeant J. G. Lynch was relieved from charge of this station, January 9, by Sergeant J. Mitchell, and transferred to New York city. Five assistants have been ordered to, and six relieved from, this station during the year. It has not been inspected during the year. Six hundred and thirteen post-offices have been regularly supplied with the Farmers' Bulletins.

Extracts from the observer's semi-annual reports:

The reports are much utilized by business men generally.

During the winter season reports of the weather are of the greatest benefit to packers and fruit and oyster dealers, and are often taken as evidence in courts. The co-operation of the different railroads with the Signal Service has advanced the interest taken in the service and its workings a great deal in the last six months, and the accuracy with which the indications are made out has gained them favor with the public.

The first vessel that entered port the present year was the propeller Nashua, from Milwaukee, which reported on the 1st of January, and cleared on the 2d. Navigation, however, may be said to have commenced on the 1st of April with the opening of insurance.

Navigation closed (except for Goodrich Transportation Company) December 16.

Forty-four cautionary signals were displayed at the station during the year.

The sergeant remarks as follows in reference to some of these displays:

August 24 and 25.—This signal was not justified at the station, yet from facts learned from marine sources it was justified upon the lake in this vicinity.

October 17 and 18.—This signal, although not justified at the station, was justified on the lake and outer bay. The Donnelly sailed during the display, and was compelled to return on account of brisk head winds.

October 29 and 30.—No sailing vessel left during the display; mariners report a heavy gale on the lake and a high sea.

November 19 and 20.—This signal, although not justified at the station, was fully justified on the lake. The schooner Clara Parker in attempting to gain the harbor was driven ashore. Ten vessels left port during the display and all were obliged to put back.

April 20.—Storm unusually severe; no damage as far as known to shipping.

April 29.—Several vessels left port lightly laden, but encountering rough weather outside had to return.

CHINCOTEAGUE, VIRGINIA.

[*Official number*, —.]

Latitude	37° 55′
Longitude	75° 20′
Elevation of barometer above mean sea-level	18.50 feet.

Established March 16, 1880.

Office, Life-Saving Station No. 7, Assateague Beach.

Private B. A. Blundon has been in charge of this station since its establishment. He has one assistant.

It was inspected in March, 1880, and found in good order. The station is located on what is known as "Old Fishing Point," on Assateague Beach, between two very dangerous shoals, viz, Turner Shoals on the southwest, which make out to sea for a distance of three miles or more, and Ship Shoals on the southeast, which extend out to sea some four or five miles.

Extracts from the observer's semi-annual reports:

> The captains of vessels and business men of Chincoteague Island place the greatest reliance in the cautionary signals, and take great interest in the service.
>
> Fourteen cautionary signals and twelve cautionary off-shore signals were displayed at this station since its opening.

The observer remarks as follows in reference to the display of signals:

> *April* 13.—Schooner C. H. Madison left harbor for sea, totally disregarding the cautionary signal flying at the time, and on reaching Williams Shoals was blown ashore, where she remained for several hours.

Established November 1, 1870.

Office, Pike's Opera House, southeast corner of Fourth and Vine streets.

Sergeant N. Gorom was relieved from charge of this station December 10, 1879, and transferred to San Francisco. Sergeant R. B. Watkins was ordered to assume charge February 19, 1880. During the interval between the departure of Sergeant Gorom and the arrival of Sergeant Watkins, Private C. N. Kitchel was in charge. Three assistants have been ordered to, and three relieved from, this station during the year. Highest water in the river, 53 feet 3 inches, occurred February 17; lowest water, 2 feet 5 inches, October 23. During the year, five hundred and forty-three post-offices have been regularly supplied with the Farmers' Bulletin. The station has not been inspected during the year.

Navigation was suspended, at intervals, during the latter part of September and October, and the 1st of November, on account of the very low water, the river not having been as low in about twenty years.

Extracts from the observer's semi-annual reports:

> The pork-packers and provision dealers watch the reports closely, and, by a little study, are enabled to take advantage of any change in the weather favorable to their business.
>
> The coal men, river men, and shippers generally, are greatly interested in our river reports, and often take advantage of information derived therefrom.
>
> The records are often called for and used as evidence in the courts and in some cases verdicts are rendered in accordance therewith.
>
> The Commercial's city editor says the reports are eagerly noted. The newspapers in Cincinnati take a deep interest in the service, and devote generous space in their columns to the reports; the river reports particularly.
>
> Business men interested in the weather probabilities for the next day or two, and desirous of obtaining facts about rainfall, temperature, &c., often visit the office and remark that the service benefits them greatly, pecuniarily, by the reliable information furnished them.

The office was moved to another room in the same building on July 26. It was inspected in September and in June. The inspector reported everything in a satisfactory condition.

Navigation closed on December 9, and the lights at the entrance to the harbor put out, but the river and lake continued unobstructed by ice until the morning of the 18th, when it froze over but was soon cleared by tugs. Navigation opened on March 9. The steamer Northwest, from

Detroit, arrived on March 9 and sailed March 10, being the first arrival and departure of regular line boat of the season.

The display of cautionary signals was suspended from December 25, 1879, until March 15, 1880.

Extracts from the observer's semi-annual reports:

Press reports have been furnished regularly to the four leading newspapers of the city and are given prominent places.

The advantage derived by the public from the reports of the service and the display of cautionary signals has been in many instances very marked. Those most interested are vessel owners, dealers in all kinds of perishable goods and produce, ice dealers, those about to go on journeys, railroad men, &c.

Whenever cautionary signals are displayed the office is generally thronged with vessel men and reporters seeking information in regard to the expected storm.

On one occasion a number of captains visited the office at 4 a. m. to obtain information in reference to the storm then raging, and at another time, upon his arrival at the office at 6.30 a. m. the sergeant found several captains in waiting, all seeking information of the storm. On several occasions information was furnished the street commissioner to guide him in lighting the street lamps at night.

Forty-six cautionary signals were displayed during the year.

The sergeant reports as follows relative to the display of signals:

July 7.—This signal was generally heeded. A number of small vessels remained in port; no disasters.

July 11.—The severest storm since the terrible winter storm of 1877.

August 15 *to* 17.—This storm was very severe on the lake. Only one vessel ventured out on the 16th, viz, the City of Montreal, one of the largest steamers on the lakes. After going out about five miles she had to return. All admit that the warning prevented many disasters, and the timely display is highly commended.

September 2 *to* 4.—This warning gave entire satisfaction to all classes of the community, especially to those interested in shipping. All vessels remained in harbor; lake very rough.

September 7.—A large fleet of vessels remained in port. Captains visiting the office report a severe storm on the lake; no disasters reported.

September 21 *to* 25.—This warning gave general satisfaction to all classes of the community; lake reported very rough after the northwest wind.

October 22 *to* 24.—Over fifty vessels remained in port from Wednesday until Saturday. A large number of captains and others visiting the office admit that the warning prevented many disasters. A very severe storm reported on the lake.

October 28.—The most severe storm of the season; not a vessel ventured out, and not one seen on the lake for twenty-four hours. The warning gave general satisfaction, and doubtless prevented many disasters.

November 17.—The warning was timely and generally heeded, and satisfaction expressed by all interested in shipping.

November 19 *to* 21.—The storm was very severe. A large number of vessels remained in harbor owing to the timely warning. The schooner Sumatra was driven ashore near union depot.

November 26 *to* 29.—The most severe storm of the season. A number of fences and trees were damaged by the gale. The display favorably commented upon by captains and owners of vessels.

March 21 *to* 24.—Signal displayed too long in advance; no vessels left port during display except one, the captain of which thought he could make Kelley's Island before the storm, but was obliged to put into Black River; several captains visited the office.

March 26 *to* 29.—No disasters at this port. The propellers Chicago and Consort went ashore on Gull's Reef, but were towed off by tugs.

Considerable interest was taken in the signal by lake captains.

April 16.—A severe gale; several collisions in the harbor; slight damage. A number of vessels which went out while the signal was up put back with damaged sails and riggings. One tug lost her tow, but afterward recovered it. The chimney of the river custom-house was blown down.

Latitude	39° 57′
Longitude	83° 3′
Elevation of barometer above mean sea-level	804.60 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for one year	29.212
Mean annual barometer (reduced to sea-level) for one year	30.043
Mean annual temperature for one year	53°.7
Mean annual rainfall for one year	31.26 inches.

Established July 1, 1878.

Office, Huntingdon Block, southeast corner of High street and Broadway.

Sergeant. D. D. Stansell has been in charge during the year. The station has not been inspected.

Extracts from the observer's semi-annual reports:

> Interest in the service continues unabated. The more direct benefits derived from the weather reports at this point are probably realized by the raisers and shippers of wheat, but the reports command a general interest, and the office receives many calls for information by the general public.
>
> The city newspapers continue the regular publication of the weather reports, which are read with great interest by every one, and the service is highly complimented by all who are interested enough to visit the office, and by those who read and watch the reports.

Established September 15, 1874.

Office, Commercial Building, corner of Collins and Beacon streets.

Sergeant H. F. McFarland has been in charge during the year. He has no assistant. The station was inspected in March. The inspector reported everything in a satisfactory condition.

Extracts from the observer's semi-annual reports:

Very little interest is manifested in the service here, as the majority of the people have never taken sufficient interest in its workings to find out and appreciate the benefit to be derived from it.

The H. and T. C. R. R. Co. have on several occasions been supplied with data to be used in suits against the road, and in several instances the information furnished has proved of great benefit.

Established May 24, 1871.

Office, First National Bank building, southwest corner of Main and Second streets.

Sergeant M. McGauran has been in charge during the year. He has no assistant.

The station has not been inspected.

Highest water in the river, 18 feet 5 inches, occurred June 26; lowest water, 1 foot 1 inch, September 14 to 30.

Extracts from the observer's semi-annual reports:

The usual interest is taken in the service by all classes of citizens. The "indications" are read by everybody, and the average high percentage of verifications elicits favorable comment.

Many gentlemen have informed me that on receiving the daily papers the weather reports are always the first news items looked for. In no State probably is the subject given more attention than in this one. The river closed on December 19, 1879, and opened January 8, 1880. The Belle of Belleview, the first boat of the season, arrived March 8, 1880.

DELAWARE BREAKWATER, DELAWARE.

[*Official number*, ——.]

Latitude	38° 48′
Longitude	75° 5′
Elevation of barometer above mean sea-level	20.00 feet.

Established January 28, 1880.

Office, second building from west-northwest extremity of Delaware Breakwater.

Sergeant S. W. Naylor was ordered to assume charge of this station

December 27. On June 23 he was transferred to Norfolk and the station placed in charge of Private William Bolton. Four assistants have been ordered to, and three relieved from, this station during the year.

The station was inspected in March and everything reported in a satisfactory condition.

Upon the establishment of this station the display station at Lewes, Del., was discontinued.

An important duty at this station is that of reporting by telegraph the arrival and departure of vessels to the Philadelphia Maritime Exchange and interested parties.

Forty cautionary signals and twenty-eight cautionary off-shore signals were displayed during the year at this station.

The observer reports as follows relative to the display of signals:

February 2 *to* 4.—American brig Quango struck the ice break during the night while coming into harbor, breaking a hole in her bottom and beginning to fill immediately; crew abandoned her and were rescued by a schooner's crew near by. Brig went ashore five miles north of Plumb Point; was pumped out by wrecking crew from Lewes and taken to Philadelphia on the 6th.

February 5.—Schooner reported aground on Brandywine shoals; wrecking steamers North America and Pioneer went to rescue, but without success.

April 18.—Schooner Wm. R. Drury reported ashore on Brandywine shoals; was taken off by the wrecking crew from Lewes, Del., April 20. This morning British bark Queen of Ceylon was washed ashore on Cape Henlopen; hauled off by tug North America 12.50 p. m. without damage.

June 1.—Schooner Wm. Conners, Capt. Thos. Morrisey, from Bangor, Me., with lumber for Philadelphia, struck on the breakwater at 1.30 a. m.; wind N. E. and heavy sea; crew of five men saved; steamer North America summoned to her assistance by Sergeant Naylor at 3.30 a. m. The schooner was finally got off at 3 p. m. with the assistance of the wreckers from Lewes, Del.; schooner total loss; deck load washed overboard, but most of it was saved.

Established November 19, 1871.

Office, Broadwell Block, corner Sixteenth and Larimer streets.

Sergeant A. C. Dobbins has been in charge during the year. There has been no assistant at the station since November 6, 1879. It was inspected in November, and, with some exceptions, was reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The press has been furnished with the local weather reports and the monthly means and other data which have been published regularly. Much interest is taken in these reports. The office is visited by parties desiring to compare barometers and for information referring to the climate of the city and State.

The interest manifested is general, and the benefits derived from our reports as a means of information cannot be estimated.

Mean annual barometer (reduced to sea-level) for eight years	29.985
Mean annual temperature for nine years	47°.5
Mean annual rainfall for nine years	33.72 inches.

Established November 1, 1870.

Office, Bank Block, corner Griswold and Congress streets.

Sergeant C. F. R. Wappenhans has been in charge during the year. There is one assistant at the station; also a civilian printer.

The station was inspected in June and reported in a very satisfactory condition. During the year three hundred and thirty-five post-offices have been regularly supplied with the Farmers' Bulletin.

Navigation closed December 11 and opened March 9.

The display of cautionary signals was discontinued December 25, and resumed March 15.

The office is connected with the Board of Trade, and various public offices, by telephone.

Extracts from the observer's semi-annual reports:

By the introduction of a telephone in this office the diffusion of meteorological data has increased in a marked degree. The list of those who desire to be informed of all orders in regard to the hoisting or lowering of cautionary signals now numbers twenty-four. All these orders are immediately sent to the press. Three firms desire and receive the direction and force of the wind at the various lake ports on receipt of the morning and afternoon reports. Whenever the order "Up Signal" indicates the approach of stormy weather, the inquiries by vessel owners and agents as to strength and direction of wind at stations on the lakes, where their vessels are estimated to be, are very frequent.

During the time of harvest of winter and spring wheat, when the price of that cereal is mainly governed by the presence or absence of rain in those regions where the harvest is progressing, the information sought, as to rain, has been very frequent, and the addition of the reports from the southwest covering the wheat region has been of incalculable value to the grain merchants on Change.

The interest taken in the Signal Corps and its published meteorological data has certainly not diminished. In the latter part of winter and during the spring the records are in demand, and meteorological information requested by merchants and shippers of grain, and during the season of navigation by vessel owners and captains, travelers, and the large lumber firms. These are followed, on the approach of winter, by produce merchants, pork men, and gatherers and dealers in ice.

By means of the tabulated reports and the maps at the Board of Trade, vessel owners watch the course of their distant vessels on the lakes, as the direction and force of wind as reported thereon permits them to estimate whether the vessel's voyage will be shortened by a favorable, or lengthened by a contrary, wind prevailing at its estimated position.

Forty-two cautionary signals were displayed during the year at this station.

The sergeant reports as follows in reference to one of these displays:

September 2 *to* 4.—Many vessels remained anchored in the river during the display. The Cleveland steamers remained at their ports, and steamers of the Union, Anchor, and Ensign lines were ordered to stop at this point. Numerous disasters are reported on the lakes.

DODGE CITY, KANSAS.

[*Official number*, 106.]

Latitude	37° 39′
Longitude	100° 8′
Elevation of barometer above mean sea-level	2,512.50 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for five years	27.386
Mean annual barometer (reduced to sea-level) for five years	29.641
Mean annual temperature for five years	53°.6
Mean annual rainfall for five years	17.47 inches.

Established September 15, 1874.

Office, southeast corner of Walnut and Second avenue.

Sergeant W. H. Clendenon was in charge until August 20, when he was relieved by Private J. W. Everly, and transferred elsewhere. With the exception of from November 6, 1879, to February 10, 1880, there has been no assistant at this station.

It was inspected in November, 1879, and June, 1880. In both instances the inspector reported the office in good order and the duties fairly performed.

Extracts from the observer's semi-annual reports:

> A fair amount of interest in the service continues to be manifested by the citizens of this town and surrounding country, and the reports are looked upon as reliable and to be of great benefit in the future. While, perhaps, there has been (since and during the late drought) less interest manifested by the grangers than heretofore, there has been an increased interest manifested by cattle owners, not only in the State, but from Texas and Colorado, and this office is visited more by them than by any other class of people for information relating to rainfall. The Kansas state board of agriculture is furnished with monthly weather reports from this station upon blanks supplied by the secretary.
>
> The office is frequently visited by strangers, especially land-seekers, who, having a natural desire to know as much about the climate of this region as possible, and recognizing the Signal Service as the most reliable agency through which information can be obtained, are prompt to avail themselves of its assistance. Monthly mean reports are furnished regularly to eleven newspapers published in this city and towns along the line of the Topeka and Santa Fé Railroad. These reports are largely read by the public, who by the interest they manifest in them give the strongest proof of the favorable estimation in which the service is held and of their belief in its increasing usefulness.

Mean annual temperature for six years	48°.5
Mean annual rainfall for six years	37.53 inches.

Established July 10, 1873.

Office, Sullivan's Block, southwest corner Sixth and Main streets.

Sergeant J. Harvey Smith has continued in charge during the year. There is no assistant at this station. It has not been inspected during the year.

Highest water in the river, 22 feet 10 inches, occurred June 23; lowest water, 1 inch, October 1 and 2.

The river was frozen over and navigation closed December 17. The first boat, in the spring, left March 5; the first arrived March 18.

Extracts from the observer's semi-annual reports:

> During the recent high water in the Mississippi River the river bulletins were eagerly scanned by the river men and the citizens generally, and were universally conceded to be of great value.

Mean annual temperature for nine years	40°.2
Mean annual rainfall for nine years	33.45 inches.

Established November 1, 1870.

Office, Edmonds' Block, southeast corner Superior and Lake avenues.

Sergeant Henry Bessant was in charge until March 10, when he was relieved by Private G. W. Scott, and ordered to Breckenridge. There is no assistant at the station. It has not been inspected during the year.

Extracts from the observer's semi-annual reports:

Great interest is manifested in the service by all classes of citizens, but principally among the shippers and mariners, and the office is frequently visited by such to ascertain the indications of the wind and weather generally.

The interest manifested by the business community is on the increase, and great reliance is placed upon the display of cautionary signals; vessels rarely leave port without consulting the office as to the probable direction of the wind, &c.

The Chamber of Commerce takes great interest in the service and in this office.

Navigation closed with the arrival of the propeller J. L. Hurd, December 3, 1879.

Harbor frozen December 12. The first boat of the season, steamer Quebec, arrived May 1.

Thirty-eight cautionary signals were displayed during the year at this station.

The display of signals was suspended December 25, 1879, and resumed March 15, 1880.

The sergeant remarks as follows in reference to these displays:

September 25.—The schooner Monticello, during the fog on the 28th, went ashore on Minnesota Point, but was gotten off without damage.

May 6.—Steamer City of Winnipeg damaged by encountering drifting ice.

Established April 1, 1873.

Office, custom-house building, northwest corner Washington and Water streets.

Corporal D. C. Murphy was in charge until May 6, when he was relieved by Private J. B. Wells, and transferred to Mount Washington. There is no assistant at this station.

It was inspected in August and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The usual interest is manifested in the service by persons whose business interests are affected by atmospheric changes.

The International Steamship Company and the fish merchants derive great benefit from the display of signals and bulletins.

Fifty-two cautionary signals and sixteen cautionary off-shore signals were displayed during the year at this station.

The observer remarks as follows in reference to some of these displays:

August 18 *to* 20.—This storm was of remarkable energy for this season of the year. Steamers were delayed, experiencing the roughest weather known for years. One English schooner, 32 tons burden, was wrecked on the island of Grand Menan; one small schooner was sunk in harbor, and much damage done to small boats. Fishing gear and lobster ponds about the docks were badly damaged. Trees and fences were blown down and roofs damaged.

September 25.—Steamer New York arrived and departed during the display; eight schooners remained in port; no damage reported.

October 13.—Steamer City of Portland arrived and departed during the display. Fourteen schooners entered port and remained during the display.

October 29.—Twenty schooners remained in port, several of which dragged their anchors; no other damage to shipping reported; considerable damage was done to houses, &c., by the wind and heavy rain.

November 19 *to* 22.—The International steamers were delayed by this storm. Steamer City of Portland arrived during the display and delayed her departure thirteen hours. About twenty-five schooners remained in port; no damage reported.

July 21.—Steamer Woodburg and twenty schooners remained in port. One of the most severe storms of the season; United States mail delayed twenty hours by the drifting snow.

February 24.—Steamer Falmouth was delayed eight hours by the storm; ten schooners remained in port; no damage reported.

Established May 25, 1873.

Office, Rindernecht's Block, southwest corner Fifth and State streets.

Corporal F. M. Neal has been in charge during the year. One assistant has been ordered to, and one relieved from, this station.

The station was inspected in May. The inspector reported the station in a fair condition.

Extracts from the observer's semi-annual reports:

The service has steadily grown in favor with all classes of citizens.

The shipping interest at this station, the value of which is $1,172,600 (values made by insurance companies), has not met with a single loss during the season. A portion of this good fortune may be attributed to an observance of the warnings given by the Signal Service at cautionary signal stations. The owners of vessels and persons engaged in commerce on the lakes receive the greatest amount of direct benefit from the service. Their experience during the severe storms of last fall has increased their admiration for, as well as their appreciation of, the service. Freight agents and others frequently ask for information which they can get from no other source than the Signal Office records. The press publishes reports furnished by this office.

Forty-five cautionary signals were displayed during the year at this station.

The display of signals was suspended December 25, 1879, and resumed March 15, 1880.

The observer remarks as follows in reference to some of these displays:

October 22 *to* 24.—The steam barge Kusohen and a schooner were disabled during the storm and came into port. A large number of vessels came in for shelter and remained during this display.

November 17.—Schooner Sasco left port during the display; was driven ashore near Fairport, and is a total wreck.

November 19 *to* 21.—Schooner Wacousta was driven ashore in attempting to enter harbor, and will probably prove a total loss. The wreck of a schooner lies six or seven miles southwest of this port; name unknown; all the crew lost. A large number of vessels remained in port during the display.

Mean annual barometer (reduced to sea-level) for eight years	29.968
Mean annual temperature for eight years	40°.7
Mean annual rainfall for eight years	34.31 inches.

Established May 24, 1871.

Office, Adler's Building, northwest corner of Ludington and Dousman streets.

Sergeant L. A. Welsh has remained in charge during the year. Private B. Bunnemeyer was temporarily in charge from November 6 to December 15, 1879, during the illness of Sergeant Welsh. One assistant has been on duty since May 25.

The station has not been inspected during the year.

A weekly summary of the observations has been furnished to the Iron Port, which is the only newspaper published in the city, and has been regularly published therein. The parties mostly benefited by the service in this vicinity are the railroad company, the shippers of iron ore, lumber, &c., and fishermen, all of whom unite in saying that the service is of great benefit to them.

The persons receiving the most benefit from the display of cautionary signals are those engaged in shipping and fishing, of which there are quite a number.

Forty-two cautionary signals were displayed during the year at this station.

The display of signals was suspended December 25, 1879, and was resumed March 15, 1880.

FORT MACON, NORTH CAROLINA.

[*Official number*, 220.]

Latitude	34° 42′
Longitude	76° 40′

Established May 23, 1878.

Office, in building formerly occupied by commanding officer.

Private G. H. Thompson was in charge of this station until March 1, when he was relieved by Corporal C. C. Corbin, and transferred to this office. Five assistants have been ordered to, and five relieved from, this station during the year.

Only sunset observations are taken, it having been established as a repair station on the sea-coast telegraph line, and for displaying cautionary signals. It has not been inspected during the year.

Extracts from the observer's semi-annual reports:

> The interest in the display of cautionary signals is steadily increasing, and the displays are of great benefit to mariners entering and clearing at the port of Beaufort.
>
> Fifty-six cautionary signals and thirteen off-shore signals were displayed during the year at this station.

The observer remarks as follows in reference to one of these displays:

> *August* 15 to 18.—The most destructive hurricane ever known in this vicinity. Estimated maximum velocity 100 miles per hour. This section is badly damaged, about 100 poles down; cable at old Top-sail Inlet was broken. The tide rose 4 feet above ordinary high tide. All the wharves and nearly all the pleasure-boats at Beaufort, N. C., have been destroyed. The business portion of the town, on the water front, for the distance of half a mile was completely demolished by heavy seas. It is estimated that the damage to crops in this and Calvert County will exceed $100,000. Morehead City suffered considerably, principally from the wind, destroying boats and damaging residences. About a half mile of the track of the Atlantic and North Carolina Railroad Company at Morehead City, including a bridge built at considerable expense, was destroyed; but one life was lost; no vessels were in harbor during the storm. Cautionary signals were displayed sixty hours in advance of the storm.
>
> A great deal of damage was done at this post; fences blown down, wells filled up, windows smashed in, and chimneys destroyed. The farmers from the suburbs report that the destruction is general throughout the country.

GALVESTON, TEXAS.

[*Official number*, 55.]

Latitude	29° 18′
Longitude	94° 50′
Elevation of barometer above mean sea-level	39.6 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	30.009
Mean annual barometer (reduced to sea-level) for eight years	30.051
Mean annual temperature for eight years	69°.6
Mean annual rainfall for eight years	51.78 inches.

Established April 19, 1871.

Office, custom-house building, Mechanic street.

Sergeant E. O'C. MacInerney has been in charge during the year.

Sergeant MacInerney was promoted from a first-class private January 13.

The station was inspected in March, and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

> Merchants of every class, but more particularly cotton merchants, take a very great interest in the daily bulletins, especially in the report of rainfall, which seems to be the portion of the reports to which they attach the greatest importance.
>
> People of almost every branch of industry consult the weather reports and indications in relation to their business. The butchers come daily, before purchasing ice, to see if a "norther" is on the way. They regulate their purchases by the information they obtain. The same can be said of the large beer dealers.
>
> Owners and captains of vessels trading at this port are always deeply interested in the weather reports and signals, and constantly crowd the office. House painters are taking a deep interest in the reports, and frequently consult them so as to regulate their daily labors on calculations founded on the present and probable condition of the atmosphere.
>
> Twenty-one cautionary signals and twenty-eight cautionary off-shore signals were displayed during the year at this station.

GRAND HAVEN, MICHIGAN.

[*Official number*, 48.]

Latitude	43° 5′
Longitude	86° 18′
Elevation of barometer above mean sea-level	620.25 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.338
Mean annual barometer (reduced to sea-level) for eight years	29.982
Mean annual temperature for eight years	46°.9
Mean annual rainfall for eight years	38.87 inches.

Established May 24, 1871.

Office, Cutler House, corner Washington and Third streets.

Sergeant S. C. Emery was in charge until October 4, when he was relieved by Corporal D. P. Waters, who was relieved by Sergeant G. R. Hancock, January 3. There is no assistant at this station.

Extracts from the observer's semi-annual reports:

> The cautionary signal is displayed from the roof of the Cutler House, which is the best point in the city for such purposes.

The months of November and December were remarkably stormy and of boisterous character, resulting in great damage to shipping at this point. No lives were lost, and no damage reported as resulting from non-display of signals.

Cautionary signals are displayed during the winter months, after the closing of navigation, for the benefit of the Northwestern Transportation Company's steamers plying between this port and Milwaukee, Wis.

Sailing-vessels generally derive direct benefits from signals and seldom sail while the signal is up. The interest in the service comes mainly from sailors, but all classes are interested to a greater or less degree, according to occupation. Fruit dealers are, perhaps, next to sailors in the amount of direct benefits received.

Seventy-five cautionary signals were displayed during the year at this station.

The sergeant remarks as follows in reference to these displays:

September 15.—Storm very severe; a large steamer of the Northwestern Transportation Company could not leave harbor. The Chicago steamer was several hours late.

October 28.—Steamer Amazon wrecked, three schooners driven ashore, and ten schooners made for harbor upon seeing signals.

November 19.—Heaviest sea of season from southwest. Propeller Paine, of Grand Haven, went on beach at 8 a. m. and broke in pieces in half an hour; schooners Margaret Doll, Maple Leaf, and Holmes, scow Reese, and barge C. O. D. went on beach between 2 and 8 a. m., Maple Leaf going to pieces; life-saving crew rescued all the crews; no lives lost. Another schooner with fore-sail gone is anchored one mile out.

February 29.—Tin roof of D. & M. depot torn off.

Mean annual barometer (reduced to sea-level) for eight years	30.010
Mean annual temperature for one year	53°.3
Mean annual rainfall for eight years	45.22 inches.

Established February 10, 1871.

Office, Blackford's Block, southeast corner Meridian and Washington streets.

Sergeant E. Lloyd has remained in charge of this station during the year. Four assistants have been ordered to, and three relieved from, this station. One assistant, Private J. C. Graham, died June 22.

The station has not been inspected during the year.

Extracts from the observer's semi-annual reports:

An abstract of the a. m. bulletins, showing the temperature, wind, and state of weather, has been furnished to the W. U. Telegraph Company, and A. & P. Telegraph Company. This was telegraphed by the above companies, with commercial quotations, to the several minor offices of this district, and also telegraphed by the Gold and Stock Company to the numerous business houses in this city. The midnight "indications" were supplied to the press.

Local records, showing the observations taken at 7 a. m., 2 and 9 p. m., and the monthly Form 22 were also furnished to the press.

The weather reports have been generally utilized by the business men of this community. During the spring and summer months the merchants consult this office whenever they desire to send their agents out on the road, or to ship such commodities as may be injured by sudden changes of temperature. The poultry men have informed me that they rely implicitly on the Signal Service for information as to the most opportune periods for killing and shipping their poultry. The records of this office have been ordered into court to be used in cases under litigation. The persons who are most materially benefited by the service are the pork-packers throughout the State. They depend entirely upon the weather reports to inform them when they can slaughter their hogs without risk. Several houses in the adjoining towns have had the weather "indications" telegraphed to them twice or three times a day during the packing season. Those of the city engaged in this business have had placed in this office a telephone for their convenience, and, if one is to judge from their constantly ringing the telephone bell whenever there is a prospect for a change in temperature, he would be apt to infer that the Signal Service at this point is for the exclusive benefit of the pork-packers of this city. There are some days twenty or thirty calls.

Messrs. Henderson, Park & Co., Martinsville, Ind., and Mr. George W. Steele, of Marion, Ind., have closed their houses for the season, but, before doing so, they telegraphed their thanks to this office, and stated that they had found the "weather indications" remarkably accurate and indispensable.

Established May 1, 1872.

Office, Schultz Building, Main street.

Sergeant L. Dunne was in charge until May 4, when he was relieved by Private J. W. Byram, and transferred to New Orleans. There is no assistant at this station. It was inspected in March and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

By authority from the Chief Signal Office certain meteorological data, from the time of opening of the station in 1872, has been furnished Dr. J. H. Pope, sanitary inspector, to be embodied in a report to the National Board of Health. Masters of vessels and others have paid marked attention to the signals, and have generally been guided by them.

Great interest is shown by the people, and the greatest confidence placed in the cautionary signals.

Twenty-six cautionary and twenty-nine cautionary off-shore signals were displayed during the year at this station.

Mean annual barometer (reduced to sea-level) for eight years	30.082
Mean annual temperature for eight years	69°.0
Mean annual rainfall for eight years	54.74 inches.

Established September 11, 1871.

Office, Freedman's Bank Building, southwest corner Pine and Forsyth streets.

Sergeant J. W. Smith has been in charge of this station during the year. He has no assistant. It was inspected in February and reported in a very satisfactory condition.

Extracts from the observer's semi-annual reports:

The amount of interest in the service has greatly increased, especially among seafaring men. The captains, agents, and owners of vessels have visited the office frequently during the past six months, all expressing great confidence in the service, and stating that great benefits have been derived from the information received. There has been a marked increase in the interest and visits of the officers of the Charleston and Savannah steamers. They have expressed great satisfaction with the storm warnings, the individual and general benefits derived, and the saving of life and property.

Persons from distant parts of the country have visited the office frequently, desiring information regarding the climate of the State, invalids, especially those suffering from pulmonary diseases, having made frequent inquiries regarding the hygrometric conditions of the atmosphere for the different months at this place. They say they have read various and conflicting statements regarding the climate of this State, especially so of the hygrometric conditions, some representing it as dry and others as loaded with moisture, and that they had learned to rely on none as correct except the reports of the Signal Service, all others being made in the interest of some land or railroad company. At times, when the extreme temperatures are of great interest, the reports from this office are accepted as correct. The editors of the Daily Florida Union and the Breeze applied to this office for the reports for publication in their respective papers. The reports are now furnished (by direction of the Chief Signal Officer), and I have been informed by the editors that the reports are of great benefit and interest to their subscribers, and that by their publication they have gained many new subscribers.

As the service becomes better known, and the reports understood, the public interest and confidence increases. Owners of vessels and wharves and shippers often call for information regarding the character of the weather at this station; the information to be used in settling disputes regarding the damaging of goods. During the display of the storm signal, and at times when the weather is threatening, the office is visited by captains of vessels, fishermen, and others, for such information as this office can give. An evidence of the appreciation of and confidence in the service, and that the information thus gained is beneficial, is their repeated visits. Many other instances could be cited, proving the great benefits of the service, and the interest manifested.

Four cautionary signals were displayed during the year at this station.

Sergeant F. Z. Gosewisch has been in charge during the year. There is no assistant at this station. It was inspected in February and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The public generally are interested in shipping, and consequently in the Signal Service, and even the few who depreciate its benefits in fair weather, are generally among the first to seek information from the bulletins and at the office whenever dangerous weather is threatened.

Every person here is more or less interested in vessels, and takes an interest in the reports of the service, the Havana reports being of great use on account of the numerous vessels running between this port and Cuba.

In foul weather all turn to the Signal Office for information, and sea-faring men recognize the importance of this station as one of the keys to the Atlantic coast weather.

Four cautionary signals were displayed during the year at this station.

The sergeant remarks as follows in reference to some of these displays:

October 5.—Every vessel at the wharves hauled into the foul-weather harbor, to save moorings, as soon as the signal was hoisted. The mail steamer Lizzie Henderson, for Cedar Keys, laid over her regular trip.

October 12.—Schooner Express in northwest channel in distress, towed in by steam-launch Nettie, of Light-House Department; sails and anchor gone and rudder broken. Owing to the timely warning no damage was done to the vessels in harbor.

Sergeant S. W. Rhode was in charge until December 1, when he was relieved by Sergeant A. W. Browne, and ordered to the central office. There is one assistant at this station. It was inspected in December and June and reported in a satisfactory condition.

Forty-five post-offices have been regularly supplied with the Farmers' Bulletin during the year.

The highest water in the river, 18 feet 9 inches, occurred July 1 and 2; the lowest, 2 feet 1 inch, December 10.

Extracts from the observer's semi-annual reports:

> The public interest manifested in the service continues to increase. During March and April, when severe wind storms were quite frequent, great numbers of persons called at the office for information in regard to the storms. Whenever the weather presents a threatening or stormy appearance, the people call at the office to obtain information as to the atmospheric conditions.
>
> During the latter part of December there were numerous inquiries made by persons engaged in packing ice, as to the prospects for a rise in temperature, &c., and the indications were studied with great interest by these parties, and their operations were almost entirely governed by the predictions.

Sergeant William Line was in charge until September 18, when he was relieved by Private Thomas Cleary, who was relieved March 12 by Sergeant W. U. Simons. There is no assistant at this station. It was inspected in February and reported in a satisfactory condition.

The highest water, 12 feet 8 inches, occurred March 14; the lowest water, 2 feet 9 inches, below zero of gauge, October 12 to 22.

Extracts from the observer's semi-annual reports:

A general interest is being developed in the service by all parties here, and daily requests are made for more reports.

Those most interested in the service are the cotton brokers, who are desirous of having reports from the cotton regions, and from points along the courses of the Mississippi and Ohio Rivers where cotton is being shipped; also the railroad companies, and those concerned in immigration, are anxious to have reports from this station published in the Northern papers, and especially those of Saint Louis, believing that such reports would show an agreeable climate, for this section, and be an effective advertisement.

Sergeant J. M. Frantz was in charge of this station until February 19, when he was relieved by Sergeant E. F. Kubel, and transferred to Red Bluff. There is no assistant at this station. It was inspected in October and found in a satisfactory condition.

Extracts from the observer's semi-annual reports:

A synopsis of Form 22 is published regularly by the Express and Herald. These reports are read with interest by all classes of citizens.

Members of the Chamber of Commerce visit the office, examine the instruments, and apparently take great interest in what they see.

The rainy season for 1879 and 1880 began October 13, 1879, and up to January 1, 1880, 11.90 inches had fallen. Heavy frosts, the latter part of December, 1879, proved disastrous to budding trees of young nurseries in certain localities. The interest taken in the service is largely on the increase. Visitors are more numerous, and are anxious to see the various instruments and have their uses explained to them. Health-seekers want facts regarding temperature, moisture, winds, &c.

I find that nearly all of the residents and visitors are interested in the rainfall records of this office.

LOUISVILLE, KENTUCKY.

[*Official number*, 64.]

Latitude	38° 18′
Longitude	85° 52′
Elevation of barometer above mean sea-level	530.00 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.479
Mean annual barometer (reduced to sea-level) for eight years	30.029
Mean annual temperature for eight years	56°.6
Mean annual rainfall for seven years	48.36 inches.

Established September 11, 1871.

Office, Courier-Journal Building, southeast corner Fourth and Green streets.

Sergeant W. R. Stansbury has been in charge of the station throughout the year. One assistant has been ordered to and one relieved from this station. It was inspected in October and reported in a satisfactory condition.

Highest water in the river, 30 feet 6 inches, occurred February 18; lowest water, 1 foot 11 inches, October 9 to 15.

Extracts from the observer's semi-annual reports:

The public interest in the service continues unabated, and the weather reports are published in the fullest manner by all newspapers.

The usefulness of the service generally, and the value of this office to the citizens of Louisville, has frequently been evinced by the occurrences of the past six months. The peculiarity of the seasons embraced in this period has rendered the weather reports of even more general interest than usual, and newspaper men constantly obtain information for incorporation in their articles, independent of the regular local reports furnished all papers by this office. Tobacco dealers have used reports furnished by the service to great advantage in the buying and selling of this article. The courts have received the Signal Service reports as evidence, and the observer has been called several times to testify during the past year.

Pork and provision dealers always consult the reports of the service in weather dangerous to their business, and are guided by them.

Doctors use the data furnished by the service in their studies of diseases and the effect of weather changes thereon. Frequent visits have been made to this office by members of the medical profession for data.

So general is the interest in, and benefit from, the service that the Signal Office is looked upon as a necessity by all classes here.

LYNCHBURG, VIRGINIA.

[*Official number*, 44.]

Latitude	37° 30′
Longitude	79° 2′
Elevation of barometer above mean sea-level	646.50 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.366
Mean annual barometer (reduced to sea-level) for eight years	30.051
Mean annual temperature for eight years	57°.1
Mean annual rainfall for eight years	41.86 inches.

Established May 24, 1871.

Office, First National Bank Building, 135 Main street.

Private Henry White was in charge of this station until April 1, when he was relieved by Private G. V. Russell, and transferred to this office. Private Russell was relieved, for discharge, June 21, by Private W. B. Hester.

The station was inspected in December, and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

> The interest taken in the work of the service is wide-spread and increasing. All classes, from sportsmen and pleasure-seekers to dealers in perishable goods and planters, study the reports and "indications," and many call at the office to get additional information of the state of the instruments before carrying out their plans. Wholesale pork and oyster dealers, and the tobacco raisers, derive the greatest benefit. The proposed publication of the "indications" along the line of the Atlantic, Mississippi and Ohio Railroad has called forth many expressions of approval.
>
> The press also regards the service with great favor, cheerfully lending all possible assistance in the way of publishing "indications," local reports, and items of general interest.

Mean annual barometer (reduced to sea-level) for one year	29.997
Mean annual temperature for one year	47°.9
Mean annual rainfall for one year	35.23 inches.

Established September 29, 1878.

Office, Brown's Block, east corner Pinkney street and Washington avenue.

Sergeant C. A. Shaw has been in charge during the year. There is no assistant at this station.

Extracts from the observer's semi-annual reports:

> The interest in the observations continues.
>
> Several visitors with barometers have availed themselves of the opportunity of testing their instruments with a standard.
>
> The newspaper reports of local observations seem to be well received.
>
> The State Journal publishes the daily "indications." These "indications" are also to be found at the post-office, in the official form, and at the railway depot, taken by the station operator and posted conspicuously.

Mean annual barometer (reduced to sea-level) for seven years	29.959
Mean annual temperature for eight years	41°.4
Mean annual rainfall for eight years	30.96 inches.

Established May 1, 1871.

Office, Adams' Block, northwest corner Spring and Front streets.

Sergeant J. T. O'Keeffe was in charge of this station until January 9, when he was relieved by Sergeant James Gilligan, and transferred to Pike's Peak. There is no assistant at this station. It has not been inspected during the year.

Navigation closed December 5, and was resumed April 28.

Extracts from the observer's semi-annual reports:

Vessel owners and masters take great interest in the service, and very few vessels leave harbor when the signal is displayed. Several of the vessel masters never leave here without visiting the office. The citizens of this place also take much interest in the service, and place great confidence in the reports.

The press furnishes a liberal amount of space for the publication of the weather reports.

Thirty-six cautionary signals were displayed during the year. The display of signals was discontinued at this station December 25, 1879, and resumed March 15, 1880.

Mean annual barometer (reduced to sea-level) for eight years	30.070
Mean annual temperature for eight years	60°.7
Mean annual rainfall for eight years	53.98 inches.

Established February 28, 1871.

Office, Guy McClellan building, northeast corner Court and Front streets.

Sergeant R. R. Martin was in charge of this station until July 28, when he was transferred to Davenport, and Private R. T. Dabney placed in charge. Corporal D. T. Flannery assumed charge of the station December 22, Private Dabney remaining as assistant. It was inspected in February and reported in fair condition.

During the year sixteen post-offices have been regularly supplied with the Farmers' Bulletin.

Highest water in the river, 34 feet 4 inches, occurred March 23 and 28; lowest water, 1 foot 11 inches, November 12 and 15.

Extracts from the observer's semi-annual reports:

Lumbermen, river-men, planters, merchants, lawyers, doctors, the general public, and the press never fail to seek the office for information. The cotton dealers are most benefited by the reports.

The Chamber of Commerce manifest great interest in reports furnished them, and special mention has been made of the weekly rainfall statement of the cotton belt furnished by the central office. The river and railroad interests derive great benefit from Signal Service reports.

Since the epidemic of yellow fever the office has been visited frequently by medical and sanitary experts in search of data, and in all instances they have been furnished with the information.

Mean annual barometer (reduced to sea-level) for eight years	29.998
Mean annual temperature for nine years	45°.1
Mean annual rainfall for nine years	34.79 inches.

Established November 1, 1870.

Office, Mitchell's building, corner Michigan and East Water streets.

Sergeant William Finn has been in charge of this station during the year. Four assistants have been ordered to, and four relieved from, this station. It has not been inspected during the year.

Extracts from the observer's semi-annual reports:

The service continues high in the estimation of the community. As reported on previous occasions the classes who derive most benefit from the service are those having shipping interests, grain dealers, pork packers, and dealers in goods that may become damaged in shipment. Representatives of these different interests have frequently acknowledged their obligations to the service.

During atmospheric disturbances, especially in the fall months, the number of vessel men who call at this office is very large, and it is gratifying to note their increased confidence in the service.

The office maintains friendly relations with the press, which has always shown a readiness to do anything in its power to advance the service.

Seventy cautionary signals were displayed during the year at this station.

The sergeant reports as follows in reference to the display of signals:

July 3.—This storm was accompanied by rain and severe thunder and lightning. Telegraph lines were blown down in many places near the city, and trees torn up. A large amount of damage from flooding occurred in the lower portions of the city. The schooner E. J. McVey, laden with lumber, water-logged some distance south of this place, lost about two-thirds of her cargo.

September 25 *to* 30.—Steamer Amazon, from Grand Haven to this port, was driven a long distance out of her course during the storm.

October 17.—Schooner E. M. Davidson reported ashore on Pilot Island; schooner R.

J. Skidmore went ashore near Manistee, and scow Frankie Wilcox reported water-logged off the same port.

November 2.—Propeller Menomonee ran on the beach 24 miles north of this place during the severest portion of the storm. Several other small disasters are reported from different parts of Lake Michigan.

November 19.—This storm was considered one of the most severe that has occurred on the lakes for years. The only disasters in this section occurred near Little Sturgeon Bay, where the schooners North Star and Elida ran ashore. A very large number of vessels took shelter at different points along this shore. On the other side of the lake the disasters were serious and many.

December 9.—Steamer Minneapolis left for Grand Haven during the display, but was obliged to put back.

May 29 *to* 31.—The schooner C. S. Davis sprung a leak and went ashore in thick weather south of this place; released with little injury.

June 4 *to* 7.—A large fleet put in here on the morning of the 6th for shelter. Three vessels are known to have been dismasted a short distance outside of harbor, and several were damaged in canvas and spars.

June 13 *to* 16.—Schooner Marion Discion caught in the gale between Racine and Kenosha, sprung a leak, capsized, and soon after drifted ashore.

MOBILE, ALABAMA.

[*Official number*, 27.]

Latitude	30° 42′
Longitude	87° 59′
Elevation of barometer above mean sea-level	39.48 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	30.045
Mean annual barometer (reduced to sea-level) for eight years	30.084
Mean annual temperature for eight years	66°.7
Mean annual rainfall for eight years	62.96 inches.

Established November 7, 1870.

Office, southeast corner Government and Royal streets.

Sergeant Charles Dill was in charge of this station until June 21, when he was relieved by Sergeant Ossian Aldrich, and ordered to Fort Whipple, Virginia, for medical treatment. There is one assistant at this station. It was inspected in March and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The committee appointed by the Board of Trade and Cotton Exchange continue their official visits of inspection. The office of the United States Engineers, located here, has repeatedly made inquiries for data of various minor importance, and have several times sent aneroid barometers to be tested. The leading daily newspapers give a large amount of space to the data furnished by the Signal Office, and have expressed gratitude for the benefit to the circulation of the paper from its publication.

On the 21st of November, 1879, a bench-mark was established for the city by request and co-operation of this office.

The interest in the working of this office manifested by the Cotton Exchange and Board of Trade is not abating but increasing, and a general desire is expressed on their part to have a greater number of reports (especially from the cotton belt) furnished to this office.

The papers publish weekly a synopsis of the Weekly Weather Chronicle, and, monthly, the summary contained upon Form 22.

A monthly report furnished to the Board of Health is published in connection with their mortuary report.

Eight cautionary signals and one cautionary off-shore signal were displayed during the year at this station.

The sergeant reports as follows in reference to the display of signals:

The display of cautionary signals for the storm of August 23 was fully appreciated. Wherever your observer and assistant went they were interviewed by citizens for information bearing upon the outlook. No damage was done in the city except the flooding of streets, but in the adjacent country the gale was quite destructive, demolishing a neighboring town (Biloxi), prostrating trees and fences, and causing the death of two persons. The rivers rose rapidly, and in the bay a rough sea was experienced. The schooner Marshall, from Boston, Mass., consigned to Gage & Co., was wrecked, and, with cargo, proved a total loss.

August 31 *to September* 2.—No serious damage was done in the immediate vicinity of this station; no vessels left port during the display.

Office, States Insurance Building.

Corporal D. P. Waters was in charge of this station until October 4, when he was relieved by Sergeant S. C. Emery. Sergeant Emery was relieved January 3, and Corporal Waters again placed in charge. On June 2 Corporal L. N. Jesunofsky relieved Corporal Waters, who was ordered to this office for discharge. One assistant has been ordered to, and one relieved from, this station during the year. Ninety-seven post-offices have been regularly supplied with the Farmers' Bulletin. Highest water, 46 feet 6 inches, occurred March 17; lowest, 5 inches, October 3.

The station was inspected in December and reported in a very unsatisfactory condition.

Extracts from the observer's semi-annual reports:

> The press publish the "Indications" and meteorological reports furnished from this office.
>
> The cotton merchants study the reports with the greatest interest. The bulletins posted in the Merchant's Exchange receive the same close scrutiny as heretofore; steamboat and river men also pay close attention to the river bulletins.

Established January 10, 1871.

Office, custom-house, Bank street.

Sergeant John K. Payne has been in charge during the year. There is one assistant at this station. It was inspected in July and not found in a satisfactory condition.

Extracts from the observer's semi-annual reports:

Cautionary signals have become well understood by the public, and are used like the almanac and the mails, by the most active and intelligent business men. Masters and pilots visit the office for information, and bring their aneroids for adjustment.

About fifty (frequently poor instruments) have been set with the station barometer.

All classes of people read the "Indications" and the daily local report which is regularly published.

Forty-three cautionary and twenty-six cautionary off-shore signals were displayed during the year at this station.

The sergeant remarks as follows in reference to the display of signals:

August 18 *to* 19.—Wire down and delay of nine hours and ten minutes occurred. Railway trains have been delayed, and telegraph lines blown down by the gale. Many large trees, one over two hundred years old, blown down, and a stone weighing four hundred and sixty-five pounds thrown from the corner of Saint James' church. Farmers report great damage to their crops. The wooden pier near the Piquot House entirely destroyed by the high tides and wind. A large number of vessels detained in harbor by the display. Steamers kept up fires, and every precaution was taken to guard against the expected gale. Many minor disasters.

November 3.—Weather bad outside, and the harbor well filled with vessels.

November 19 *to* 21.—Schooner Emma L. Cottingham went ashore on Ten Tree Island and sunk.

Mean annual barometer (reduced to sea-level) for eight years	30.062
Mean annual temperature for eight years	68°.9
Mean annual rainfall for eight years	65.44 inches.

Established November 1, 1870.

Office, in the custom-house.

Sergeant George H. Rohé was in charge until May 4, when he was relieved by Sergeant L. Dunne. There is one assistant at this station.

The river observations were taken from the new gauge September 1.

The instrument shelter was removed to the third floor of the custom-house on September 8. The office was moved to an adjoining room on the same floor on November 25.

Highest water, 10 inches above high water of 1874, occurred April 24; lowest water, 4 feet 4 inches, November 22.

The station was inspected in March and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The interest of the members of the Cotton Exchange in the reports continues to increase. The sugar planters have recently manifested an increased appreciation of the value of the service. The newspapers devote considerable space to the reports furnished them. The midnight and river bulletins are published in the three morning papers, while the German and French papers publish the afternoon weather and river bulletins. A weekly and monthly summary and a report of the local observations are also published.

Seven cautionary and two cautionary off-shore signals were displayed during the year at this station.

Extract from special reports relative to cautionary signals:

August 31 *to September* 2.—In the city the damage to buildings, fences, signs, &c., will probably be covered by $15,000. Damage to boats in harbor estimated at $10,000. A fleet of coal-boats lying above the city was generally damaged; out of 68 boats 43 were sunk, involving a loss estimated at $215,000. Three barges of the Mississippi Valley Transportation Company, in tow of the tug John Gilmore, were sunk about 12 miles above Baton Rouge. These barges were loaded with grain, and the loss is estimated at $103,000. William Bust, the pilot of the John Gilmore, was drowned while attempting to reach the shore from one of the barges. The steamboat Trenton capsized at Conrad Point, between this city and Baton Rouge, and, with cargo, will prove a total loss. At Morgan City the damage is estimated at $30,000. At Berwick, on the opposite side of Berwick's Bay, the damage is $15,000. The damages to the buildings on the sugar plantations in the southwestern part of the State is very great. The damage to the sugar and cotton crops is variously estimated. The most reliable estimates place it at 10 per cent. The damage to the rice crop is slight. Trains on the Chicago, Saint Louis and New Orleans Railroad were delayed by a wash-out of 6 miles in length. The signal was hoisted full 12 hours before the storm became severe.

Office, custom-house, southeast corner Thames and Franklin streets.

Sergeant William McGillivray has been in charge during the year. There is no assistant at this station. It was inspected in July and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The interest heretofore manifested in the service still continues and is greatest among those engaged in shipping. There are numerous applications for latest "Indications." These inquiries are usually made by seamen and travelers.

Fifty-one cautionary and twenty-nine cautionary off-shore signals were displayed during the year at this station.

The sergeant remarks as follows in reference to these displays:

July 8.—Nearly all the vessels in harbor were obliged to cast double anchors. Heavy rain and fog during display; no disasters.

August 18.—Two fishing smacks and one sloop were wrecked, and an old steamer was sunk at wharf. Several other minor accidents are reported.

September 25.—United States steamer Minnesota anchored in the outer harbor, drifted ashore near Fort Adams; she was gotten off without serious damage.

February 19.—Storm very severe, several vessels detained. The frame-work of the cassino building (in process of erection) suffered some damage; no marine disasters reported.

April 13.—About 6 p. m. an unknown schooner sunk off Old Field's Point; nothing saved; no disasters reported in this vicinity.

NEW RIVER INLET, NORTH CAROLINA.

[*Official number*, 138.]

Latitude	34° 30′
Longitude	77° 23′

Established May 18, 1876, as a repair station.

Office, observatory of Dr. E. W. Ward's dwelling.

Private Ransom White was in charge until December 1, when he was relieved by Private J. C. Ashton and ordered to this office. There is no assistant at this station.

Extracts from the observer's semi-annual reports:

There are a number of small coasting vessels that ply between Wilmington, N. C., and this place, and the captains of these vessels are furnished with the weather "Indications" by telegraph from this office.

The farmers in this vicinity take a lively interest in the service.

NEW YORK CITY, NEW YORK.

[*Official number*, 15.]

Latitude	40° 42′ 43″
Longitude	74° 0′ 3″
Elevation of barometer above mean sea-level	164.33 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.870
Mean annual barometer (reduced to sea-level) for eight years	30.033
Mean annual temperature for nine years	51°.2
Mean annual rainfall for nine years	43.30 inches.

Established November 1, 1870.

Office, Equitable Building, 120 Broadway.

Sergeant Alois Donhauser was in charge until January 9, when he was relieved by Sergeant J. G. Lynch. Sergeant Lynch's management of the station was not satisfactory to this office and he was relieved March 17 by Sergeant E. B. Garriott and transferred to Pittsburg. Two assistants have been ordered to, and two relieved from, this station during the year.

Seven hundred and nineteen post-offices have been regularly supplied with the Farmers' Bulletin.

The station was inspected in July, 1879, and June, 1880, and was found in a satisfactory condition.

Extracts from the observer's semi-annual reports:

> The various mercantile and maritime bodies, principal among which are the Maritime, Produce, and Cotton Exchanges and the Chamber of Commerce, continue to manifest the greatest interest in the service. The Maritime Exchange is the headquarters for sea-faring men, and all reports and information relating to the weather are of particular interest to its members. Efforts are being made to connect this office with their rooms by telephone in order that information can be more quickly transmitted. The interest taken in the service by the community at large is manifested by the number of reporters from the daily papers who frequent the office for weather notes and items contained in the reports. Bankers, oyster dealers, produce merchants, &c., send their clerks to this office daily to copy such data of the daily bulletin as may be of special importance to them. Records of past years continue to find their way into the various courts and are oftentimes of great importance. Constant requisitions are made by steamship companies, railroad companies, bankers, brokers, &c., for data past and present. The graphic map continues to be looked upon as one of the most important and practical publications of the service.
>
> Fifty-three cautionary and twenty-three cautionary off-shore signals were displayed during the year at this station.

NORFOLK, VIRGINIA.

[*Official number*, 30.]

Latitude	36° 51′
Longitude	76° 19′
Elevation of barometer above mean sea-level	54.50 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	30. 017
Mean annual barometer (reduced to sea-level) for eight years	30. 064
Mean annual temperature for eight years	58°. 7
Mean annual rainfall for eight years	52.83 inches

Established January 1, 1871.

Office, corner Main and Gray streets.

Sergeant T. F. Townsend was in charge until January 28, when he was relieved by Sergeant C. A. Smith. Sergeant Smith was relieved March 5 by Corporal Wm. Davis, who was relieved June 23 by Sergeant S. W. Naylor. Three assistants have been ordered to, and three relieved from, this station during the year.

Extracts from the observer's semi-annual reports:

> The interest in the service is generally increasing. The cautionary signals are looked upon with general interest, and very few vessels leave port while signals are displayed.
>
> The office is consulted daily by all classes, and especially those contemplating a trip by land or water.
>
> Cape Henry vessel reports, that are received through the chief signal officer at this office, are of great benefit to the different steamship companies, as they can anticipate the time of the arrival of their vessels in Norfolk.

The storm of August 18 made a complete wreck of this section as well as the southern portion of the coast telegraph line, causing an interruption of telegraphic communication for a short time. With this exception it has been well maintained and all weather and wreck reports promptly reported. The value of the forecasts at this station is best illustrated by the frequent special reports asked for from the central office by ship owners and captains when about undertaking the transportation of disabled vessels, or any voyage wherein bad weather would be dangerous. The eagerness with which the "Indications" and other reports are read and consulted attest the confidence of the public. The advantage and facilities afforded by the coast wire for the saving of life and property is duly appreciated by all.

Thirty-two cautionary and eight cautionary off-shore signals were displayed during the year at this station.

Extracts from special reports relative to the display of signals:

August 18.—Maximum velocity for five minutes was at the rate of 72 miles per hour. The most severe and destructive wind and rain storm that has visited this section for over half a century. Wharves raised and washed away by the high tide, trees uprooted, houses unroofed and blown down by the violence of the storm. The wooden portion of the spire of the Baptist church, some 80 or 90 feet in height, was blown down; loss estimated between $3,000 and $4,000. The damage to property in the city is variously estimated at from $150,000 to $200,000. A fearful record of about fifteen minutes' work of the tempest. The schooner Marion Hubbard went aground and stove to pieces; schooner Annie E. Adams, lumber-laden, bound for Baltimore, was driven ashore. Several unknown vessels are reported in distress in Hampton Roads.

Mean annual barometer (reduced to sea-level) for five years	29. 613
Mean annual temperature for five years	48° .1
Mean annual rainfall for five years	18.27 inches.

Established September 18, 1874.

Office, court-house.

Sergeant H. U. Jones has been in charge during the year. There is no assistant at this station. It was inspected in October and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The interest taken by the public generally is steadily increasing, but the land department of the Union Pacific Railroad Company receives perhaps the most direct and substantial benefit from the Signal Service, as the weather reports appear to show the steady increase of rainfall west of the one-hundredth meridian, and the company is thus enabled to sell land to settlers in a section of country which heretofore has been considered unfit for agricultural purposes, owing to the lack of moisture.

The record of the rainfall seems to be most considered and talked about, and is copied and preserved by numerous individuals for future reference.

Established November 1, 1870.

Office, custom-house, corner Fifteenth and Dodge streets.

Sergeant Charles Dill was in charge of this station until December 10, when he was relieved by Sergeant L. M. Dey and transferred to Mobile. He has one assistant.

The station was inspected in August and reported in a satisfactory condition.

Highest water in the river, 16 feet 3 inches, occurred July 1 and 2; lowest water, 2 feet 1 inch, March 16.

Extracts from the observer's semi-annual reports:

River free from ice on March 20. Navigation was not resumed until April. On the 23d of that month the steamer Red Cloud arrived from Saint Louis.

On April 18 the river gauge was adjusted to correspond to the readings of the bridge gauge.

The office continues to receive many visitors who are in quest of reliable information regarding meteorological changes and conditions.

The office continues to have the support of the local press, of the citizens generally, and of commission and stock men particularly; the latter named always being guided in large commercial transactions by the record at this office and the "Indications" as issued from the central office.

The Omaha Daily Herald and the Republican have published daily press reports and a monthly meteorological summary.

Established November 1, 1870.

Office, Grant Block, southeast corner First and Bridge streets.

Sergeant J. O. Barnes was in charge until December 10, when he was relieved by Sergeant S. W. Beall and transferred to Albany. One assistant has been ordered to, and one relieved from, this station during the year. It was inspected in August and reported in a satisfactory condition.

Navigation closed December 5, 1879, and was resumed March 21, 1880.

Extracts from the observer's semi-annual reports:

Confidence is placed in the cautionary signal displays by seamen, and the warning generally heeded.

Shipping men and merchants derive the most benefits from the service at this station.

All classes of citizens come to the office to inquire about the weather, and vessel men who are interested pay close attention to the *manifold* bulletins.

The Palladium, Times, and Syracuse Evening Herald are each furnished with a copy of the morning bulletin. The Palladium and Times also publish a local report.

Thirty-four cautionary signals were displayed during the year at this station.

The display of signals ceased December 25, 1879, and was resumed March 15, 1880.

The sergeant reports as follows in reference to the display of signals:

November 19 *to* 21.—Schooner Donunson sailed on the 19th, encountered the storm, and in attempting to put back to this harbor lost her bearings and went ashore about three miles up the lake and will prove a total loss; valued at $2,500; insured for $1,000.

April 10.—Schooner David Andrews, Captain McCrimmon, bound from Napance to Toronto, disabled and driven ashore four miles from Oswego. Vessel and cargo of 10,000 bushels of rye a total loss. Schooner J. J. Hill came in during the storm and was driven against the bridge, carrying away her boom.

April 16.—The schooner Great Western, bound from Toronto to this port, with lumber, encountered the gale, losing part of her cargo, her boat, and part of her canvas.

OCEAN CITY, MARYLAND.

Latitude	38° 20′
Longitude	75° 3′

Established January 13, 1880.

Corporal J. C. Rickli has been in charge since the establishment of the station. There are no meteorological instruments at the station, it being a repair station of the sea-coast telegraph line. It was inspected in March and found in a satisfactory condition.

Extracts from the observer's semi-annual reports:

> The winter and spring having been remarkably mild, no wrecks have occurred in this vicinity.
>
> The "Indications" have, whenever practicable, been posted up in a conspicuous place, and are highly appreciated by the public.

PEMBINA, DAKOTA TERRITORY.

[*Official number*, 86.]

Latitude	49° 0′
Longitude	97° 5′
Elevation of barometer above mean sea-level	791.00 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for six years	29.136
Mean annual barometer (reduced to sea-level) for five years	29.965
Mean annual temperature for five years	35°.9
Mean annual rainfall for six years	21.03 inches.

Established November 1, 1872.

Office, Second, near Hutsman street.

Sergeant James Cassidy has been in charge during the year. He has no assistant.

The station has not been inspected during the year.

The office was moved on March 30, 1880, to Second, near Hutsman street. The present office is much more suitable than the old one, both as regards the comfort of the observer and the exposure of the instruments.

Since April 28 no telegraphic reports have been sent, owing to the fact that the line which crosses the Red River was broken by a passing steamboat and has not been repaired.

Extracts from the observer's semi-annual reports:

> The year that has just ended was an unusual one in many respects. The rainfall for the spring and summer months was much less than usual, but still was sufficient for agricultural purposes.
>
> There is a great deal more interest taken in the service than formerly, as the rowdy element is in a great measure disappearing before the influx of a better class of citizens.
>
> A weekly weather report is furnished the Pembina Pioneer.

PENSACOLA, FLORIDA.

[*Official number*, 231.]

Latitude	30° 25′
Longitude	87° 12′
Elevation of barometer above mean sea-level	29.75 feet.

Established October 27, 1879.

Office, southwest corner Palafox and Saragossa streets.

Sergeant R. R. Martin has been in charge of this station since its establishment. He has no assistant.

This was formerly a display station of the Signal Service. It was inspected in March and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

Since the office has been opened it has been visited by a very large number of citizens of all classes, who seem to take a very great amount of interest in the service, and who have, one and all, expressed themselves much pleased with the establishment of a signal station at this place, the commercial interests of which are already well developed and rapidly growing in importance. The most important branch of business here at present is the lumber trade, Florida furnishing immense supplies. Pensacola has become one of the great centers for its distribution, and sends forth annually immense quantities of hewn and sawed timber to the North and to Europe. It is not unusual to see over a hundred large vessels in the harbor at one time, consequently shippers and mariners are most directly interested in and benefited by the service.

The bulletins are daily consulted, and the monthly summaries published by the press attract special attention. The display of cautionary signals is highly appreciated by those most interested—masters of vessels, fishermen, &c., as well as by the public generally. Some of the displays attracted special attention, notably that of April 29, which caused considerable alarm and excitement among the citizens (because of the violent cyclones that had so recently swept over the West and Southwest, scattering death and destruction in their paths). Parents sent to the schools and brought their children home; several merchants closed their places of business and awaited with fear and trembling the coming storm which the signal portended. All classes express confidence in the service; those most directly benefited are shippers and mariners.

Six cautionary and one cautionary off-shore signal were displayed during the year at this station.

PHILADELPHIA, PENNSYLVANIA.

[*Official number*, 17.]

Latitude	39° 57′
Longitude	75° 10′
Elevation of barometer above mean sea-level	52.42 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	30.008
Mean annual barometer (reduced to sea-level) for eight years	30.048
Mean annual temperature for nine years	53°.1
Mean annual rainfall for eight years	42.93 inches.

Established January 1, 1871.

Office, Chamber of Commerce building, 133 South Second street.

Sergeant C. A. Smith was in charge until February 6, when he was relieved by Sergeant T. F. Townsend and transferred to Norfolk. Six assistants have been ordered to, and five relieved from, this station during the year. It has not been inspected since the date of last report.

Eight hundred and twenty-seven post-offices have been regularly supplied with the Farmers' Bulletin during the year.

The room occupied as an office proper is still donated, free of rent, by the Commercial Exchange Association.

Extracts from the observer's semi-annual reports:

In January telegraphic communication was opened with Delaware Breakwater, from which point, and Cape May, reports of the movements of shipping and items of maritime interest have been received and furnished the Maritime Exchange, Shipmasters' and Vessel Owners' Association, and the Philadelphia Exchange, who furnish the information received to the newspapers and general public, thus widely disseminating news of interest that has heretofore been exclusive.

The courtesies of the different newspapers have been extended to the office at all times, and a disposition evinced to advance the interests of the service, and to give space in their columns for the publication of anything of interest or profit to the public.

The value of the service is too general to specify any particular body that is benefited more than another. At the office we are, perhaps, brought more directly in contact with the grain interests, as every sale or purchase is based on meteorological conditions, and all bulletins are eagerly sought and studied.

The observer was summoned and testified in court from the office records twice during the half year. As illustrating the variety of subjects on which the weather records are brought directly or indirectly to bear, one of these cases was a famous divorce suit, tried in November last. The other was a suit for damages against the Philadelphia and Reading Railroad Company on account of injuries sustained by excursionists on that road on October 4, 1877, during the prevalence of the cyclone of that date. Extracts from the records were furnished to parties for avowed use in the courts once during the half year. Several extracts have also been furnished to different parties for unknown uses.

Mean annual barometer (reduced to sea-level) for six years	29.957
Mean annual temperature for six years	19°.3
Mean annual rainfall for six years	30.68 inches.

Established November 1, 1873.

Office, summit Pike's Peak.

Corporal Edmund Davis was in charge of the station until January 9, when he was relieved by Sergeant J. T. O'Keeffe and transferred elsewhere. One assistant has been ordered to, and two relieved from, this station during the year.

The station was inspected in November. The management of the office was not such as to be satisfactory, and Corporal Davis was soon after relieved and eventually discharged from the service.

The supply station at Colorado Springs is also under the charge of the sergeant at Pike's Peak.

Extracts from the observer's semi-annual reports:

> Tourists, prospectors, ranchmen, and cattle men are the persons most benefited, and all of them testify to the advantages derived from the reports.
>
> There is little local benefit derived from this station, but a full monthly report is published in the local papers and the citizens of Colorado Springs seem to take quite an interest in it.

Mean annual barometer (reduced to sea-level) for eight years	30. 005
Mean annual temperature for eight years	51°. 9
Mean annual rainfall for eight years	36.58 inches.

Established November 1, 1879.

Office, First National Bank building, north corner Fifth avenue and Wood street.

Sergeant E. B. Garriott was in charge until March 11, when he was relieved by Sergeant J. G. Lynch and transferred to New York City. Four assistants have been ordered to, and four relieved from, this station during the year. On October 14 the office was moved to an adjoining room in the same building. It was inspected in May and reported in a satisfactory condition.

Highest water in the river, 21 feet 7 inches, occurred February 14; lowest water, 1 foot 1 inch below zero of gauge, October 20.

The six months ending December 31 were remarkable in river annals for the unprecedented continuance of low stages of water. On July 27, 28, and 29 the river attained a sufficient depth to allow coal flats to go down; from this date low water continued until the middle of November, when another temporary rise occurred. During the entire month of December the rivers were sufficiently high for navigation.

Three hundred and twelve post-offices have been regularly supplied with the Farmers' Bulletin during the year.

Extracts from the observer's semi-annual reports:

> The interest manifested by the general public in the office publications is not as much as at some other stations, but it is progressing steadily. The greatest benefits are derived by wheat speculators, particularly during the summer and early autumn months, when the market is essentially dependent on the state of the weather. Shippers and importers of perishable goods are also interested, and have learned to study the weather reports before making their shipments or ordering their supplies.
>
> The publication of the weather reports by the press of this city has materially increased during the past six months, more space being given and fuller reports published, much to the satisfaction of the community at large. The members of the press take the liveliest interest in the service as is shown by the numerous editorials favorably commenting upon it. The river reports are of considerable benefit to those interested in river navigation. The "Indications" and weather reports are of interest and benefit to all classes.

PORT HURON, MICHIGAN.

[*Official number*, 17.]

Latitude	42° 58′
Longitude	82° 29′
Elevation of barometer above mean sea-level	632.86 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for five years	29.320
Mean annual barometer (reduced to sea-level) for five years	29.975
Mean annual temperature for five years	45°.5
Mean annual rainfall for five years	33.07 inches.

Established July 25, 1874.

Office, City Hall building, corner Broad and Huron avenues.

Sergeant Joseph E. Mayhew was in charge until July 26, when he was relieved by Sergeant W. O. Bailey and discharged the service. Two assistants have been ordered to, and two relieved from, this station during the year. It was inspected in June and reported in a satisfactory condition.

Navigation closed December 14 and was resumed March 22.

Extracts from the observer's semi-annual reports:

> Since September 1, 1879, this office has prepared and furnished (through the O. C. S. O.) the Michigan State Board of Health with a Monthly Meteorological Register, comprising all the principal data relating to the station's meteorology, including a report upon ozone observations; data intended for publication in the annual report of the board.
>
> The display of cautionary signals during the season just passed has been of inestimable service to vessel owners and mariners generally, particularly to those going from Buffalo to Chicago. When "Up-Signals" are displayed the office is repeatedly visited by vessel captains, and, as a rule, upon learning that dangerous winds are anticipated, they delay sailing until after the storm has apparently passed or cautionary signal lowered. I have been informed that when sailing up the Saint Clair River they are invariably upon the lookout for the signal as they approach this port, and when it is up rarely venture beyond this place. I have never met any one connected with this class who did not pronounce the reports and cautionary warnings as indispensable to their interests, and it is a source of much gratification to notice the unlimited and fully established confidence with which mariners and the shipping interests generally regard these timely warnings.

The officers of the Northern Transit Company have manifested a decided interest in the labors of the service, and pronounce the published weather reports as indispensable to their interest.

On June 23, 1880, the cautionary signal indicator was changed from F. W. Parson's dock office to the Marine Reporter's office, which is located upon the dock, and is a common headquarters for tug captains and mariners generally.

Fifty cautionary signals were displayed during the year at this station.

The display of signals ceased December 25, 1879; resumed March 15, 1880.

The sergeant reports as follows in reference to the display of signals:

July 11.—The storm of this date was very severe and destructive; several buildings were unroofed and a portion of the Methodist Episcopal church destroyed. Numerous shade trees were blown down; the telegraph lines in this vicinity are reported down. Damage in the city estimated at $25,000.

September 2 to 4.—During the display the office was visited by several captains and other persons interested in vessels expecting to leave port. Barge Geo. S. King started out, but upon encountering the gale upon the lake put back and remained in harbor during the display. Propeller Bertschey was shipwrecked and lost off Port Austin; no lives lost; life-saving crew did excellent work during this storm.

October 22 to 24.—A schooner (name unknown) was caught in the storm six miles off Crawford's Quarry, and lost her fore and mizzen masts. Schooner O. M. Bond was washed ashore at Sand Beach. The tow-barge Tecumseh lost her main-mast during the gale and returned to this port.

November 19.—Storm very severe on the lake. A number of shipwrecks, with several lives lost, are reported from Sand Beach Harbor. Several vessels sailed while the signal was up, but meeting a rough sea were forced to put back.

November 22.—Dismasted vessel reported ashore near Port Austin.

April 9.—A number of vessels put out of port, and after a short run up shore turned back. Schooner Home washed ashore near Port Hope.

PORTLAND, MAINE.

[*Official number*, 12.]

Latitude	43° 40′
Longitude	70° 16′
Elevation of barometer above mean sea-level	45.39 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.933
Mean annual barometer (reduced to sea-level) for eight years	29.972
Mean annual temperature for eight years	46°.1
Mean annual rainfall for eight years	38.61 inches.

Established January 15, 1871.

Office, custom-house building, corner Pearl and Fore streets.

Sergeant Will T. Boyd was in charge until September 27, when he was relieved by Sergeant John Laurens and transferred to Smithville, N. C. One assistant has been ordered to, and one relieved from, this station during the year. It was inspected in August, and the work was found to be satisfactorily performed.

The display stations of Section No. 7 are under the immediate supervision of the sergeant at this station, all signal orders being transmitted through him.

Extracts from the observer's semi-annual reports:

The interest taken by shipping men and merchants in the Signal Service weather reports continues unabated, and the reports have been principally beneficial to these classes. The records of the station have frequently been consulted for legal purposes, and on one occasion (April 9, 1880) were produced in court as evidence.

The office is now connected by telephone with all the principal institutions and business houses in Portland, the expenses having been paid by a number of steamboat men and merchants interested in securing the latest weather reports.

Forty-four cautionary and twenty-two cautionary off-shore signals were displayed during the year at this station.

The sergeant reports as follows in reference to the display of signals:

November 3.—During the storm schooner Leesburg went ashore on Cape Elizabeth crew of five men supposed to have been lost. Several disasters of minor importance occurred in this vicinity.

March 23 to 26.—Schooner Octavia Dow, lying in harbor, dragged her anchor and went ashore on the breakwater; no other damage reported in this vicinity.

Mean annual barometer (corrected for temperature and instrumental error only) for two years	29.972
Mean annual barometer (reduced to sea-level) for eight years	30.080
Mean annual temperature for eight years	53°.2
Mean annual rainfall for eight years	53.43 inches.

Established November 1, 1871.

Office, Oregon and Washington Mortgage Savings Bank building, No. 48 First street.

Corporal R. R. Herman has been in charge during the year. He has no assistant. One assistant has been ordered to, and two relieved from, this station.

Navigation to the sea was continued throughout the winter season. Navigation between this city and the Cascades of the Columbia River closed December 23, 1879, and reopened January 3, 1880.

Highest water in the river, 27 feet 1 inch, occurred June 30; lowest water, 1 foot 3 inches, October 31.

The station was inspected in November and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The Daily Morning Oregonian and the other daily newspapers publish the reports regularly.

The press has evinced more interest in the service than heretofore.

The destructive wind storm of January 9, 1880, had the effect of increasing the public interest in the Signal Service reports, and for some time after the storm an unusual number of citizens visited this office.

The wharves along the river are erected on piles; each has two floors, and any sudden rise in the river necessitates the removal of wares from the lower floors or lower wharves. In this respect the special river reports have proven of great value.

The records of the office have been used as evidence in the county court, and many inquiries are made at this office for meteorological data.

PORTSMOUTH, NORTH CAROLINA.

[*Official number*, 137.]

Latitude	35° 2′
Longitude	76° 4′

Established April 23, 1876, as a repair station; partial observations commenced May 9, 1876.

Office, in United States Marine Hospital Building.

Private Louis Leonardy was in charge until December 12, when he was relieved by Private T. J. Kenan, who was relieved by Private R. Graham, March 16. There is no assistant at the station.

It has been continued as a repair station, but partial meteorological observations are taken and forwarded by mail weekly.

The station was inspected in February and found in fair condition.

Extracts from the observer's semi-annual reports:

The line on this repair section has been thoroughly patrolled and kept in good condition. Schooner L. A. Van Brunt was driven ashore three miles north of Ocracoke during hurricane of August 18; wreck station was opened for her, but as line was only working as far north as Kittyhawk and south to Lookout, no assistance could be rendered.

Ship Jacob Trumpy came ashore fourteen miles south of station December 13, 1879; wreck station was opened; particulars telegraphed to the central office and owners notified.

Mean annual barometer (reduced to sea-level) for eight years	30.074
Mean annual temperature for eight years	73°.5
Mean annual rainfall for eight years	45.03 inches.

Established August 15, 1871.

Office, International Ocean Telegraph Company's building.

Sergeant A. W. Browne was in charge until October 3, when he was relieved by Private W. J. Evans and transferred to Leavenworth. There is no assistant at the station.

Extracts from the observer's semi-annual reports:

The interest in the service and the benefits derived by the public are for the most part confined to masters of vessels in the cattle trade, plying between this port, Key West, and the island of Cuba. These parties occasionally make inquiries in regard to the weather, but it is always to know what the "Indications" are, or what the weather is at some other port. Owing to the fact that neither "Indications" nor reports are received, it has been impossible to furnish information of much value.

This station is furnished with a telescope, which has been of practical benefit in enabling the observer to inform interested parties of the arrival of vessels several hours in advance of their reaching the wharf, thus giving the cattle shippers time to have their cattle ready for shipment upon the arrival of the vessels.

Established July 1, 1877.

Office, Crandall's Hall, Main street.

Sergeant R. B. Watkins was in charge until February 19, when he was relieved by Sergeant J. M. Frantz and transferred to Cincinnati. There is no assistant at the station. It was inspected in November and reported in a satisfactory condition.

River observations were taken from December 15, 1879, to March 15, 1880. The highest water, 17 feet 5 inches, occurred December 20; lowest water, 11 inches, February 8.

Extracts from the observer's semi-annual reports:

The interest taken in the service is not confined to any particular class; all are alike interested in so far that there is a desire by most every one to know the amount of rainfall, the velocity of the wind, the highest and lowest temperature, and for everything pertaining to the weather this office is considered authority.

The service is fully appreciated by ranchmen and stock-raisers, and by the public generally.

Bulletin-boards are eagerly watched.

The Evening Sentinel publishes local reports daily and a portion of the monthly summary.

Frequent visits are made to the office by reporters for amounts of rainfall, which items are of great value to the public.

Mean annual barometer (reduced to sea-level) for eight years	29.975
Mean annual temperature for nine years	46°.9
Mean annual rainfall for nine years	38.15 inches.

Established November 1, 1870.

Office, Power's Building, corner Main and State streets.

Sergeant James Gilligan was relieved January 9 and ordered to Marquette, and the assistant, Private J. C. Walshe, placed in charge. One assistant has been ordered to and one relieved from this station during the year.

Lake navigation closed December 5 and was resumed March 20.

The river was frozen over at Charlotte Harbor on December 21, 1879, and navigation on the Erie Canal was officially declared closed on December 6, 1879.

The station was inspected in September and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

> The daily and weekly newspapers of the city continue to publish in a neat and compact form all weather reports and "Indications," together with local reports and telegraphic items furnished relating to meteorological changes. They also publish notices referring to the success of the Weather Bureau and the value of its labors to the country at large. All telegrams relating to the display of cautionary signals, either at this point or elsewhere, have been furnished to the newspapers and to parties interested, such as ship-owners and shippers, importers, &c.
>
> The office has been visited very often by persons seeking information as to the "Indications," references to the weather for past years, and information on miscellaneous subjects connected with meteorology. They belonged to nearly every class in the community, and comprised merchants, shippers, importers, traders, doctors, farmers, lawyers, builders, manufacturers, ship captains, and officials of the common council and board of water-works.
>
> During the winter months the office was visited daily by several ice-dealers and the reports carefully consulted in reference to the "ice crop." Several vessels remained in Charlotte Harbor during the displays of cautionary signals, particularly during the months of November and December, 1879, and the masters often visited this office for the purpose of ascertaining, if possible, the duration and extent of the storms, and expressed their confidence in the warnings and their determination to be guided to a large extent by them.
>
> No disasters have been noted during the year in this neighborhood.
>
> Thirty-seven cautionary signals were displayed during the year at this station.
>
> The display of signals ceased December 25, and was resumed March 15, 1880.

Mean annual rainfall for two years	40.31 inches.

Established August 2, 1877.

Office, West House Hotel, southwest corner Water street and Columbus avenue.

Sergeant W. A. Massey has been in charge during the year. One assistant has been ordered to, and one relieved from, this station. It was inspected in June and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

There can be no doubt as to the great advantage resulting from the display of signals at this point, as in this immediate vicinity occur some of the severest storms known on the lakes. The signal can be seen readily from Kelley's Island (with a glass), distant 12 miles, between which and Sandusky pass the greater number of lake craft between the east and west ends of Lake Erie, and the great estimation in which these warnings are held has been confirmed by conversations with many lake captains, and by the fact that a sailing vessel never leaves port during a display unless the captain is convinced that the storm has passed.

The storm warning being generally justified at this point, their display convinces those interested that any preparations necessary should be made at once.

The weather reports have latterly come into very great favor among the farmers, ice, coal, and pork men, and now many more than ever before consult the bulletins and "Indications." The interest in the service in all its workings cannot be increased.

Fifty-three cautionary signals were displayed during the year at this station.

The display of signals ceased December 25; resumed March 15, 1880.

The sergeant reports as follows in reference to the display of signals:

July 11.—Maximum velocity 72 miles per hour. Considerable damage was done in the city and vicinity; trees uprooted, chimneys blown down, and several large buildings unroofed. Schooner Geo. H. Warmington was struck by lightning but not seriously damaged. Several small boats tied along the docks broke loose and were blown away. Steamer Grace McMillan, with 400 excursionists, was caught in the gale but escaped without damage.

August 16.—Steamer Ferris had a hole stove in hull at Lakeside by being driven against wharf. Steam-yacht from Toledo beached at Put-in-Bay Island. Yacht Phaon, from Port Huron, capsized and was beached on Cedar Point.

October 29.—Canadian schooner Mary Lydia was sunk.

November 17.—A small boat capsized in bay; occupant saved. Yacht Flora, with a gunning party of five on board, had a hole stove in her bow; party rescued by propeller from Johnson Island. Neither steam nor sailing vessels left or entered harbor during the display.

November 24.—Sailboat Elvira, of Port Clinton, was picked up in lake off Kelley's Island; no trace of her crew has been found.

April 18 *to* 20.—Steam-propeller Eagle experienced a rough time between middle buoys and Put-in-Bay Island; shipped several seas that nearly extinguished her fires.

April 29.—The steamers Gazelle and Ferris did not come over from the island as usual on account of the severe storm.

Mean annual barometer (reduced to sea-level) for six years	30.026
Mean annual temperature for six years	51°.6
Mean annual rainfall for six years	54.76 inches.

Established December 10, 1873.

Office, building of the Atlantic and Pacific Telegraph Company.

Corporal William Stein was in charge of this station until June 22, when he was relieved by Private G. W. Taylor, and ordered to this office for discharge. Four assistants have been ordered to, and three relieved from, this station during the year.

Extracts from the observer's semi-annual reports:

This station has continued to receive all the reports of passing vessels made by the Cape Henry Signal Station, which, over a loop connecting this office with the Maritime Exchange at New York City, are repeated to that point, as also are all the reports of wrecks, &c., furnished by the central office, which latter, in addition to other business, are also transmitted to the sergeant in charge of the New York Signal Station. Much attention is paid to the cautionary signals at this point by out-going vessels, and it is seldom that vessels leave the bay when the signal is displayed. They will often return to the bay, if under way, upon the hoisting of the signal, excepting when the off-shore signals are hoisted, the meaning of which seems to be well understood by the mariners as indicating westerly or northwesterly winds, which, if not blowing a gale, are most favorable for vessels going out.

The morning and evening "Indications," which are received daily at this station, are furnished to the Ordnance Department at this point, and are posted in front of the ordnance office.

Seventy-nine cautionary and fifty cautionary off-shore signals were displayed during the year at this station.

The observer reports as follows in reference to the display of signals:

November 19 *to* 22.—Schooner Mary Chitton, from New York, with general cargo, bound to Cinidad, Bolivia, dragged ashore on West Beach, half a mile below Sandy Hook main light. After the wind abated the vessel was floated off and proceeded on her way.

February 2 *to* 4.—Schooner Stephen Harding, of Damariscotta, Me., and the brig Custalia, of Richmond, Me., were driven ashore; no loss of life.

February 29.—Steamship State of Nevada run aground at 12.30 a.m.; was floated at 10.45 p.m., and proceeded on her way to New York.

April 13.—Schooner Xebec, from Porto Rico to New York, with cargo of molasses, went ashore one mile south of station at 2.45 a. m., 14th, and was floated at 6.50 a. m., same day.

Mean annual barometer (reduced to sea-level) for eight years	30.025
Mean annual temperature for eight years	56°.0
Mean annual rainfall for eight years	23.20 inches.

Established March 8, 1871.

Office, Merchants' Exchange, California street.

Sergeant C. E. Brinsmade was in charge until December 10, when he was relieved by Sergeant N. Gorom, and discharged the service on account of physical disability. There is one assistant at this station who has been on duty during the year.

The station was inspected in September and reported in a satisfactory condition.

Ninety-six post-offices have been regularly supplied with the Farmers' Bulletin during the year.

Extracts from the observer's semi-annual reports:

The number of steamers taking the simultaneous observations for publication in the International Bulletin has been largely increased during the year. These reports are now collected from all steamers of the Pacific Mail, Occidental and Oriental, Pacific Coast, Oregon Railroad and Navigation, and California and Mexican S. S. Lines, examined, errors corrected, and then forwarded to the office of the Chief Signal Officer.

Some interest is manifested in the service by the public, but its workings appear to be but little known. Those consulting the reports at the Merchants' Exchange are interested in the shipping; those at the Produce Exchange are engaged in buying or shipping provisions, cereals, &c. The members of the Produce Exchange complain that the reports now furnished by the service do not show the climatic conditions of points in the San Joaquin and other great grain-producing valleys of this coast. Reliable rainfall reports from these sections are very desirable and much sought for, as most of the industries of this State depend upon the annual amount of rainfall.

Reports are furnished to four daily and three weekly papers for publication, and fourteen copies of Form 22 are furnished to the press monthly.

The meteorological committee of the Chamber of Commerce have visited the office regularly each month, and have taken much interest in the same.

Office, Commercial Building, corner Bay and Drayton streets.

Sergeant P. C. Guthrie has been in charge of the station during the year. One assistant has been ordered to, and one relieved from, this station.

The station was inspected in February and reported in a satisfactory condition. Certain necessary instructions were given the observer.

Extracts from the observer's semi-annual reports:

The classes of citizens appearing to derive the greatest amount of benefit from and mostly interested in the information furnished by the Signal Service are members of the Cotton Exchange, planters, mariners, commission merchants, and lawyers; also many travelers journeying by water. All classes whose business or pleasures are affected by the weather are interested in the service.

Ten cautionary signals and one cautionary off-shore signal were displayed during the year at this station.

Established September 3, 1871.

Office, Martin's Building, corner Milam street and Martin's Lane.

Sergeant E. F. Brady has been in charge during the year. Since October 13 there has been no assistant at this station. From April 10 to May 4, during the illness of the observer, Private J. W. Byram was in charge.

The highest water in the river, 23 feet, occurred April 3; lowest water, 3 feet 6 inches below zero of the gauge, November 1 to 4.

September 30, Major Wilson, employé of the United States Engineer Corps, placed the zero of the river gauge at low-water of 1879, which is 2 feet 8 inches below the low-water mark of 1878.

Extracts from the observer's semi-annual reports:

The river men and members of the Cotton Exchange highly appreciate the value of the daily river reports, and great interest has been awakened in the service among the business men of this section.

The press continues its former ready support of the service, and in addition to the ordinary full weather report each issue of both papers contains the river report in full.

The office is often visited by persons in quest of information relative to weather changes likely to ensue.

The value and utility of the data collected in this office is known to the medical profession and is sometimes practically utilized by them.

SMITHVILLE, NORTH CAROLINA.

[*Official number*, 133.]

Latitude	33° 55′
Longitude	78° 1′
Elevation of barometer above mean sea-level	32.70 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for four years	30.054
Mean annual barometer (reduced to sea-level) for four years	30.086
Mean annual temperature for four years	63° .4
Mean annual rainfall for four years	56.80 inches.

Established October 15, 1875.

Office on Front street.

Sergeant R. Seyboth was in charge until September 27, when he was relieved by Sergeant W. T. Boyd and transferred to Baltimore. Three assistants have been ordered to, and two relieved from, this station during the year. It was inspected in February and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The service is well thought of by the pilots and fishermen who reside, here and also by all mariners who come to this port. The signals are closely observed as a general thing, and the facilities for sending and receiving reports by telegraph are greatly appreciated by the shipping men here, and through the use of the Signal Service telegraph line between Smithville and Wilmington they are saved much delay and annoyance.

Thirty-five cautionary and seven cautionary off-shore signals were displayed during the year at this station.

The sergeant reports as follows in reference to the display of signals:

August 15 *to* 19.—British bark Indiana remained in port owing to signals; German bark Mary (581 tons), anchored between inner and outer bars, was driven ashore and lost all of her masts.

February 2 *to* 4.—Schooner A. F. Randolph, from Bridewater, N. S., in ballast, went ashore at the Fingers, near Baldhead light; Captain Warner and crew of five men were saved; vessel will be a total loss.

SAINT LOUIS, MISSOURI.

[*Official number*, 66.]

Latitude	38° 37′ 28″
Longitude	90° 15′ 16″
Elevation of barometer above mean sea-level	567.57 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.468
Mean annual barometer (reduced to sea-level) for eight years	30.031
Mean annual temperature for eight years	55°.5
Mean annual rainfall for eight years	39.67 inches.

Established November 1, 1870.

Office, Saint Louis Life Insurance building, northwest corner Sixth and Locust streets.

Sergeant J. H. Weber has been in charge during the year. Three assistants have been ordered to, and three relieved from, this station.

The station was inspected in December and reported in a satisfactory condition.

Highest water in the river, 22 feet 2 inches, occurred June 30; lowest water, 3 feet 6 inches, December 26.

Three hundred and sixty-eight post-offices have been regularly supplied with the Farmers' Bulletin during this year.

Extracts from the observer's semi-annual reports:

> Two large weather maps are displayed, as heretofore, in the Merchants' and Cotton Exchanges. These maps are continually consulted by the merchants.
>
> A monthly statement of the stage of water in the river at this point has been furnished to Capt. O. H. Ernst, Engineer Corps, U. S. A., in this city, since May, 1880.

The following resolution was adopted by the Merchants' Exchange:

> *Resolved by the board of directors of the Merchants' Exchange of Saint Louis*, That we, in our representative as well as individual capacity, give expression to our deep sense of appreciation of what has already been accomplished in this direction in the past; that we cannot speak in terms of too high commendation of the admirable system that seems to have pervaded and animated the service in all its branches and ramifications since its creation; that we ascribe its efficiency, as evidenced by tangible and visible results, and which has been largely enhanced from year to year, to wise legislation and competent administration, through discipline and perfect system; that we feel proud of an organization, the equal of which is not to be found elsewhere on the face of the globe, and to which the older nations of Europe look as a model worthy of their study and imitation; that we hope to see its sphere of usefulness still further extended in the future by the fostering care of Congress; that we heartily recommend and indorse all proper legislation in furtherance of this object, and that we repose the most implicit and unfaltering confidence in the executive and organizing ability of the Chief Signal Officer, whose long experience in the service entitles his counsels and suggestions to be sought and heard in relation to any improvements to be ingrafted upon the system as it now exists.

SAINT MICHAEL'S, ALASKA.

[*Official number*, 119.]

Latitude	63° 48′
Longitude	161° 60′

Established June 28, 1874.

Office, southernmost building of Alaska Commercial Company. No report from this station has been received.

Extracts from the observer's semi-annual reports:

The past winter has been one of unusual severity, not so much from a great depression of the temperature at one time but from long continued cold weather, accompanied by high winds or gales and snows, especially in February and March. January was very cold but far less windy than the preceding and following months.

The oldest natives say they do not remember another winter combining such an extraordinary snow-fall with low temperatures and heavy gales.

The winter was very severe throughout the country as far as can be ascertained, the temperature falling to 69° below zero at Fort Reliance, 400 miles southeast of Fort Yukon, although at both these places the temperatures were very severe, yet the snowfall only reached about 6 inches in depth on a level up to January 1, 1880, and 14 inches up to the time spring set in, in April. From the mouth of the Sanana River down the Yukon, and along the sea-coast from the mouth of the Kuskoquim River to Cape Prince of Wales, Behring's Straits, during the months of February and March, there were experienced a series of intensely cold gales accompanied by falling or drifting snow, which reached a depth of from 5 to 8 feet on a level, and of which remains still linger in the form of large drifts.

The natives narrowly escaped a destructive famine, and in some cases were forced to eat their dogs and the tanned sealskin covers of their boats, while numbers of their dogs died of starvation.

The spring was extremely late, the ice remained an unbroken sheet far to seaward up to the 20th of June, and up the Yukon to Fort Reliance the season was from ten to fifteen days later than usual.

All migratory birds arrived eight to ten days behind time, and even now the grass has but just begun shading the hillsides with green, and hardy flowers are scattered here and there over the ground.

SAINT PAUL, MINNESOTA.

[*Official number*, 39.]

Latitude	44° 53′
Longitude	93° 5′
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.109
Mean annual barometer (reduced to sea-level) for seven years	29.937
Mean annual temperature for eight years	43°.8
Mean annual rainfall for nine years	29.57 inches.

Established November 1, 1870.

Office, Ingersoll Block, corner Third and Wabasha streets.

Sergeant O. S. M. Cone has been in charge during the year. An assistant was on duty at this station until March 6, since which time the sergeant has performed the duties of the station without assistance.

The highest water in the river, 15 feet 3 inches, occurred June 17; lowest water, 10 inches, September 28.

The station has not been inspected during the year.

The highest water known here since 1875 occurred on June 17, and measured 15 feet 3 inches above bench-marks. The low lands opposite the station were flooded, and many residents had to move out of their homes during the high water. The river gauge used at this station was destroyed by a steamboat on June 19, 1880, and was replaced by a new one on June 30.

Navigation on the Mississippi River was considerably interrupted during the latter part of the season by low water. The first steamboat up the river arrived at Saint Paul on April 21, 1879, while the last boat to leave this point was the Cheever, on October 25, 1879, making 187 days of steamboat navigation. The river was clear of ice on March 26, 1879, and not completely frozen over until December 8, 1878.

Extracts from the observer's semi-annual reports:

The citizens of this vicinity continue to manifest much interest in the weather reports and "Indications," as published in the daily papers, and the manifold bulletins. The city of Saint Paul has gained three lawsuits during the last six months by the records of the weather at Saint Paul being submitted as evidence.

The depth of water in the river, as shown by river gauge, is consulted daily by many people interested in river navigation, and is also published in the daily papers. Considerable interest is manifested in the reports of the weather at this station; most particularly by the wheat and grain speculators and the members of the Chamber of Commerce.

THATCHER'S ISLAND, MASSACHUSETTS.

[*Official number*, 125.]

Latitude	42° 36′
Longitude	70° 34′
Elevation of barometer above mean sea-level	48.12 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for four years	29.940
Mean annual barometer (reduced to sea-level) for four years	29.992
Mean annual temperature for four years	47°.4
Mean annual rainfall for four years	48.59 inches.

Established December 26, 1875.

Office, Signal Service Building, central part of the island.

Private E. C. Goss has been in charge during the year. He has no assistant.

The station was inspected in August and reported in a fair condition.

Extracts from the observer's semi-annual reports:

When the cautionary signal is hoisted at this station all passing vessels within sight of the island invariably make for harbor, either in Gloucester or Rockport, and remain until the signal is lowered before venturing out to sea. This precaution is so strictly adhered to by vessels of every description, passing near this station, that the percentage of wrecks is very small. The fishing and coasting trade derives the greatest amount of benefit from the reports. The service is growing in popularity, and the same confidence is placed in the reports, by the public, as in previous years. The telegraph line and cable between the island and Rockport has been in good condition throughout the year.

Fifty-one cautionary and twenty-nine cautionary off-shore signals were displayed during the year at this station.

The sergeant reports as follows in reference to the display of signals:

August 18.—Steamer Star of the East, while off this island, had her port paddle box carried away and hurricane deck badly damaged.

October 19.—A large number of vessels were passing the island, bound north, when the signal was being hoisted; they immediately put about and made for Gloucester. Schooner Octavia A. Dow, of Monhegen, Me., engaged in shore mackerel fishing, had her foremast carried away while off the island during the gale, and put into Gloucester for repairs.

January 2.—Schooner F. J. Wonson, Captain Spun, went ashore this morning near Rockford; was taken off by the wrecking steamer S. E. Wetherill, and towed to Gloucester for repairs; schooner slightly damaged, with loss of rudder.

February 3.—Schooner Abbie Bursley, Capt. William B. Baker, from Georgetown, Me., for Philadelphia, Pa., cargo, ice, went ashore at Lanesville, near Rockport, during the gale; crew of eight men were taken off by Lanesville fishermen before the life-saving men arrived; vessel belongs to Barnstable, Mass.; partly insured; lies in bad position, and will probably become a total loss.

March 24.—Schooner Mary A. Rice, Captain Clay, owned by E. B. Gardner and others, of Bucksford, Me., bound from New York to Newburyport, Mass., while passing the island was struck by a severe squall, which carried away mast and all running rigging. Revenue cutter notified, came after vessel, took her in tow and carried her to Gloucester.

Latitude	41° 40′
Longitude	83° 32′
Elevation of barometer above mean sea-level	651.19 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.326
Mean annual barometer (reduced to sea-level) for eight years	29.991
Mean annual temperature for nine years	50°.4
Mean annual rainfall for nine years	30.84 inches.

Established November 1, 1870.

Office, Finlay Block, southeast corner Summit and Madison streets.

Sergeant Allen Buell has been in charge during the year. One assistant has been ordered to, and one relieved from, this station.

Navigation closed December 20, and opened March 13.

Extracts from the observer's semi-annual reports:

The newspapers take great interest in the service. The Commercial is now publishing a full tabulated report of the midnight observations. The Blade publishes the morning observations. It can be said that the service has been of marked benefit to our merchant marine. No violent storm doing damage has passed over the station, for which a signal has not been ordered. Navigation opened March 13, 1880, although boats had been arriving and departing nearly all winter. The observer has been subpœnaed to appear in court with the records of the office to testify in commercial cases.

In many instances vessels have been detained in port by the cautionary signal. Fifty-one cautionary signals were displayed during the year at this station.

The sergeant reports as follows in reference to the display of signals:

July 11.—Storm very severe in surrounding country, trees blown down, telegraph wires broken, crops injured, and much damage by lightning; no casualties are reported at this station.

August 15.—The signal had the effect of keeping all vessels in port; those on the lake during the storm were damaged; no casualties are known to have occurred.

August 24 *to* 26.—The shipping had ample warning and no disasters are reported. Steamers and vessels remained in port; heavy sea reported on Lake Erie on the night of the 24th.

September 1 *to* 4.—Storm very severe on the lake during the entire display; no casualties reported. A few steamers were more or less damaged, and the steamer McMillan had her wheel-house stove in.

November 9.—Heavy winds are reported from Southern Michigan on the morning of the 3d, uprooting trees and blowing down telegraph poles, &c. A large fleet of vessels in port awaiting a favorable wind.

November 19 *to* 21.—Storm very severe on the lake. Fishermen report considerable damage to their nets, &c. Much damage done to fences and telegraph poles in the surrounding country; numerous disasters on the lakes.

November 26 *to* 29.—No damage at this station by the storm. Very few, if any, vessels left port without consulting this office; storm very severe on the lake.

April 16.—Storm very severe. The steamer Granite State attempted to go out during the display of the signal, but had her bulwarks stove in and her cargo damaged to some extent. The schooner Storker slipped her cables and went ashore, but was gotten off all right.

June 5.—Steamer Waite was the only vessel that left port on the 6th. She made a trip to the island and reports a very rough passage. A large fleet of vessels sought shelter in bay; no damage or disasters.

Mean annual barometer (reduced to sea-level) for two years	30.143
Mean annual temperature for two years	53° .7
Mean annual rainfall for two years	9.16 inches.

Established July 15, 1877.

Office, on bank of California River; township, 5 N.; range, 28 E.; section 17.

Private J. B. Wells was in charge until August 23; Private J. A. Perkins from August 23 to January 19; and Private R. P. Sibley from January 19 to date.

An assistant was temporarily on duty from October 10 to November 19, during the illness of Private Perkins.

Navigation closed on the Upper Columbia River December 19, and was resumed January 19, which was about one month earlier than usual.

The highest water, 21 feet 4 inches, occurred July 1, 1879; lowest water, 2 feet 1 inch, November 30 and December 1.

The station was inspected in September. The inspector reported that the duties had been negligently performed, and the observer, Private Perkins, was relieved from duty and discharged from the Signal Corps.

Extracts from the observer's semi-annual reports:

> Emigrants in coming to this section of the country to locate find the Signal Office a source of considerable benefit to them in ascertaining the amount of rainfall, and other general items regarding the climate of this section of Oregon.
>
> Daily observations of the river gauge in the Columbia River are made, and weekly reports of the same are furnished Col. G. L. Gillespie, Corps of Engineers, U. S. A., Portland, Oreg., and Lieut. C. F. Powell, Engineer Corps, U. S. A., Cascade Locks, Oreg.
>
> Since the 1st of May a weekly statement of the actual barometer readings has been furnished Mr. D. Chaplin, La Grande, Oreg., for the purpose of comparison in surveying for the Oregon Railroad and Navigation Company.

Sergeant J. M. Watson has been in charge during the year. Three assistants have been ordered to, and three relieved from, this station.

The section of coast line and telegraph equipments at this station were inspected in August.

The station was inspected in August and was reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

A great deal of interest is taken in the service, the reports are closely studied by many, and the reports of signals displayed and lowered at other stations, as well as special reports of wrecks (which are received here as special messages and regularly bulletined on arrival), are closely watched by the mariners, and published in the daily papers. Very favorable comment was made in regard to the signals displayed for the very severe gale of August 18, several captains of vessels saying they would never again go to sea when a signal was displayed.

Twenty-six cautionary and seven cautionary off-shore signals were displayed during the year at this station.

The sergeant reports as follows in reference to the display of signals:

August 15 *to* 18.—The damage in the city was mostly confined to the prostration of fences, chimneys, and the upper limbs of trees. A portion of a two-story dwelling-house was blown down, also a brick wall. Schooner H. W. McColly broke loose from her moorings and drifted below Market street. The German bark Fritz von der Lanchen broke from her moorings. The Swedish brig Thor had her sails split and rigging cut; the latter damage being inflicted by a piece of tin covering blown from Worth & Worth's shed. The German bark Marie went ashore on the Middle Ground during the storm. The pilot-boat Henry Waterman is ashore on Bald Head, and the Rose Scarborough at Gander Hill. The British bark Kate Bonsfield is ashore above Battery Island, but will be gotten off without difficulty.

WINNEMUCCA, NEVADA.

[*Official number*, 139.]

Latitude	41° 00′
Longitude	119° 21′
Elevation of barometer above mean sea-level	4,345.25 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for two years	25.632
Mean annual barometer (reduced to sea-level) for two years	29.992
Mean annual temperature for two years	49°.8
Mean annual rainfall for two years	8.06 inches.

Established July 1, 1877.

Office, Central Pacific Hotel.

Sergeant E. F. Kubel was in charge until February 19, when he was relieved by Corporal John R. Williams. There is no assistant at this station. It was inspected in November and reported in a satisfactory condition.

Extracts from the observer's semi-annual reports:

The Daily Silver State publishes a synoptic review of Form 22, a daily record of the maximum and minimum temperature of the preceding day, and the morning bulletin.

Drovers interested in cattle shipment consult the weather reports to determine as to the expediency of transferring stock from place to place; exposure to cold weather at points on the road between stock-yards generally resulting in loss of stock.

WOOD'S HOLL, MASSACHUSETTS.

[*Official number*, 60.]

Latitude	41° 33′
Longitude	70° 40′
Elevation of barometer above mean sea-level	34.37 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	29.973
Mean annual barometer (reduced to sea-level) for seven years	30.206
Mean annual temperature for seven years	48°.6
Mean annual rainfall for seven years	46.29 inches.

Established January 1, 1873.

Office, Fish building.

Private J. D. Sumet was in charge until March 5. His management of the station was so unsatisfactory to this office that he was relieved by Sergeant John Healy, and transferred to Boston as assistant.

The station was inspected in July, and the inspector reported it in fair condition.

Full observations are taken at this station, but not reported by telegraph except when specially called for.

No reports are received from other stations.

Extracts from the observer's semi-annual reports:

This being a station for the display of cautionary signals, those interested in shipping are more benefited than other classes by the service. Hundreds of coasters and other vessels pass through Vineyard Sound daily in full sight of the signal flagstaff on Nobsque Point, and when the cautionary signal is flying many vessels can be seen making for Vineyard Haven and other harbors in this vicinity.

Forty-eight cautionary and twenty-eight cautionary off-shore signals were displayed during the year at this station.

YANKTON, DAKOTA.

[*Official number*, 95.]

Latitude	42° 45′
Longitude	97° 30′
Elevation of barometer above mean sea-level	1,228.44 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for six years	28.716
Mean annual barometer (reduced to sea-level) for five years	30.003
Mean annual temperature for five years	45°.4
Mean annual rainfall for six years	28.25 inches.

Established April 1, 1873.

Office, Bruce's Block, corner Third and Capitol streets.

Sergeant P. J. Huneke was in charge until March 10, when he was relieved by Corporal T. A. Taylor. There is no assistant at this station. One was on duty, temporarily, during the illness of the observer, from February 10 to March 26.

The office was moved to Bruce's Block on August 1.

The station has not been inspected during the year.

On June 1 a river gauge was placed in position on river front at corner of Pine and Second streets. This was put up at the request of the Peck and Coulson Steamship Company, for the annual June rise, and proved very useful to them.

Highest water in the river, 12 feet 2 inches, occurred July 1, 1879; lowest water, 10 inches, March 16.

Extracts from the observer's semi-annual reports:

Those deriving the greatest benefits from the service at this point are steamboat men and river men, to whom the river reports are very useful during the summer. Considerable interest has been taken this summer, by citizens, in the temperature and rainfall data.

The Press and Dakotaian continue to publish reports, giving stage of water, maximum temperatures, and rainfall during the day; also to publish the "Indications" for this section received with press reports.

No reports of any description are received at this station.

FLYING-STATION AT LIFE-SAVING STATION NO. 5, FALSE CAPE, NORTH CAROLINA.

[*Official number*, 219.]

Latitude	36° 38′ 15″
Longitude	73° 53′ 00″

Established May 20, 1878.

Office, in United States Life-Saving station.

Private R. H. Paxton has been in charge during the year. He has no assistant.

The station was inspected in February and reported in a satisfactory condition.

The duties of this station are, first, to keep in repair the sea-coast telegraph lines from Cape Henry to Kittyhawk; second, in case of a wreck to proceed to and open telegraph station at a point on the coast near the wreck; to promptly communicate all the particulars to this office; to notify the Life-Saving stations near the wreck, and to render all possible assistance.

The repair man from this station is required to make a weekly trip over the entire section to examine the lines and make all needed repairs.

FLYING-STATION AT SLOOP POINT, NORTH CAROLINA.

[*Official number*, 232.]

Latitude	34° 19′
Longitude	77° 48′

Established May 27, 1878.

Office, small building owned by Mr. D. McMillan.

Corporal C. C. Corbin was in charge of this station until March 15, when he was relieved by Private H. S. Gardiner. One assistant has been ordered to, and one relieved from, this station.

The office has been enlarged and greatly improved during the year.

There are no meteorological instruments at this station.

It was inspected in February and reported in satisfactory condition.

Extracts from the observer's semi-annual reports:

> The regular repair trips have been faithfully performed, and many poles cut off and reset to prevent future trouble.
>
> When I heard of the wreck of the Marian Gage, of Philadelphia, I proceeded at once to the scene. She was ashore south of New River. I arrived at 4 p. m. on the 4th of September, 1879, opened wreck station, reported the disaster by wire to the central office, and rendered all the assistance in my power. I received instructions from office of the Chief Signal Officer on the 6th of September, to discontinue the wreck station. The iron poles, erected where the wooden poles have become too short and worthless, prove to be what has long been wanted on the coast line. Sloop Point section is now in perfect condition.

FLYING-STATION AT LIFE-SAVING STATION NO. 23, LITTLE EGG HARBOR, NEW JERSEY.

[*Official number*, 222.]

Latitude	39° 30′ 5″
Longitude	74° 17′ 28″

Established as a repair station January 20, 1879.

Office, in Life-Saving Station No. 23.

Private J. H. Fox was in charge until March 1, when he was relieved by Private C. W. Chambers, who was relieved April 21 by Private W. Daly. In addition to keeping that section of the telegraph line in repair, the man in charge is obliged, in case of wrecks, to at once place himself in communication with them, to render all aid in his power, and to promptly report the particulars to this office by telegraph.

Sunset observations only are taken, which are forwarded to this office by telegraph, daily, when the observer is not absent on repair duty. A daily journal is kept.

This station has not been inspected during the year.

* Reporting at date of last annual report, June 30, 1879.

Report of stations on the United States military telegraph line, New Mexico division, compiled from the annual report of Lieut. James Allen, Third United States Cavalry, acting signal officer in charge, and from data on file in the office of the chief signal officer:

ALBUQUERQUE, NEW MEXICO.

[*Official number*, 196.]

Latitude	35° 4′
Longitude	106° 40′

Established July 1, 1876.

Private R. G. Linthicum was in charge until September 11; Private H. E. Higgins, from September 11 to October 5; civilian operator, William Baber, from October 5 to November 20; civilian operator, W. M. Smith, from November 20 to June 25, and civilian operator, E. E. Simpson, from June 25 to date. Civilian operator, Robert Reeder, was assistant operator from May 1 to June 18, 1880.

Number of messages during the year.—Sent paid, 3,513; received paid, 2,905; sent free, 798; received free, 528; total, 7,744.

Receipts.—This line, $1,156.30; other lines, $1,040.70; sundry, $8.40; total, $2,205.40.

The station is supplied with a complete set of telegraph instruments and repair tools, and certain meteorological instruments.

No meteorological observations are taken.

A daily sunset observation is forwarded by telegraph.

The repair section of this station extends to Algodones, 24 miles north, and to Isleta, 12 miles south.

ALEMAN, NEW MEXICO.

Latitude	33° 1′
Longitude	107° 00,

Established May 1, 1879, as a repair station. It is 52 miles north of La Mesilla, of which it is a branch office.

Private John Haines, Company E, Fifteenth Infantry, is in charge.

The station is supplied with a complete set of telegraph instruments and repair tools.

All business transacted is credited to, or charged against, the La Mesilla office.

In case of trouble on the line this station is found useful. It has also been of great benefit during the year's campaign against hostile Indians. The two principal Indian trails across the Jornada del Muerto are situated, respectively, 3 miles below and 7 miles above this station. Several times during the year the crossing of hostile Indians has been reported to district headquarters within two hours thereafter, and for some time during the year the station was used as headquarters by the district commander.

The repair section extends to Round Mountain, 25 miles north, and to Leasburg, 31½ miles south.

BAYARD (FORT BAYARD), NEW MEXICO.

[*Official number*, 170.]

Latitude	32° 46′
Longitude	108° 10′

Established February 16, 1876.

Civilian operator, Charles V. Hugo, was in charge until November 1; Private H. E. Higgins, from November 1 to February 1, and civilian operator, T. A. Donahoe, from February 1 to date.

Number of messages during the year.—Sent paid, 568; received paid, 566; sent free, 1,585; received free, 1,378; total, 4,097.

Receipts.—This line, $162.51; other lines, $91.01; sundry, $4.01; total, $257.53.

The station is supplied with a complete set of telegraph instruments and repair tools.

Thre are no meteorological instruments at the station.

A daily sunset observation is forwarded by telegraph.

For purposes of repair this station is attached to Silver City.

The office is in the headquarters building. But little commercial business is transacted. Fort Bayard, being the most important military post on the line the office, is maintained for military purposes.

It has been inspected once during the year.

BELEN, NEW MEXICO.

Latitude	35° 1′
Longitude	106° 45′

Established June 1, 1876.

This is a branch office of Los Lunas, and is 10 miles south of that place.

It is under the charge of Mr. John Becker, who receives no compensation.

All business transacted is credited to, or charged against, the Los Lunas office.

In many cases this office has been found of benefit.

BERNALILLO, NEW MEXICO.

Latitude	35° 21′
Longitude	106° 31′

Established June 1, 1879; ordered closed May 2, 1880.

This office was supported until May 1, 1880, by the citizens of Bernalillo, but owing to the establishment of a Western Union telegraph office at this place, and the refusal of the citizens to contribute any longer to the support of the military office, it was closed on the above date.

CRAIG (FORT CRAIG), NEW MEXICO.

[*Official number*, 180.]

Latitude	33° 42′
Longitude	107° 8′

Re-established as a repair station November 1, 1879.

Private W. D. McChesney is in charge. All business transacted is credited to, or charged against, the Socorro office.

This station, which has been closed since June 27, 1879, was re-opened for the purpose of facilitating repairs and for the accommodation of troops operating against hostile Indians in the southern portion of the Territory. It has been of great benefit in these respects. It was inspected in May.

The repair section extends to Socorro, 32 miles north, and to Round Mountain, 24 miles south.

CUMMINGS (FORT CUMMINGS), NEW MEXICO.

[*Official number*, 214.]

Latitude	32° 18′
Longitude	107° 32′

Re-established March 1, 1879, as a repair station.

Private John Cronin, Company E, Fifteenth Infantry, is in charge.

This is a branch office of Silver City, 51 miles south, and all business transacted is credited to, or charged against, that office.

In the year's campaign against hostile Indians the station has been invaluable to the district commander and to officers commanding troops in the field. It has been the headquarters of a force of nearly one thousand troops, actively engaged in field operations, whose movements have been directed mostly by telegraph from Santa Fé via Fort Cummings.

The most important trails used by hostile Apaches, from the United States to Mexico, are within a few miles of this station, and several times the approach and passage of Indians on these trails have been promptly communicated to district headquarters, to troops in the field, and to citizens and settlers, enabling them to take prompt action whereby many lives and much property have been saved.

The repair section extends to Slocum's Ranch, 31 miles southeast, and to Hot Springs, 24 miles northwest.

EL PASO, TEXAS.

[*Official number*, 195.]

Latitude	31° 46′
Longitude	106° 32′
Elevation of barometer above mean sea-level	3,956.00 feet.
Mean annual rainfall for one year	6.63 inches.

Established November 5, 1877; observations commenced April 13, 1878.

Office, north side Santa Fé street.

Sergeant S. W. Naylor was in charge until August 1; Private W. D. McChesney, from August 1 to May 20; Private J. H. Fox from May 20 to June 20, and Private W. T. Miles, from June 20 to date. Private Joseph H. Fox is assistant.

Number of messages during the year.—Sent paid, 1,094; received paid, 900; sent free, 1,100; received free, 774; total, 3,868.

Receipts.—This line, $558.92; other lines, $601.55; sundry, $1.60; total, $1,162.07.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Four full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

The station was inspected in April.

This office is of much importance in connection with Indian troubles and frontier matters. It is within one mile of Fort Bliss, a four-company post now being built.

The repair section extends to Cottonwood's Ranche, 30 miles northwest, and to Old Fort Quitman, 85 miles southeast.

LA MESILLA, NEW MEXICO.

[*Official number*, 181.]

Latitude	32° 17′
Longitude	106° 48′
Elevation of barometer above mean sea-level	4,124.00 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for the year ending June 30, 1880	26.070
Mean annual barometer (reduced to sea-level) for the year ending June 30, 1880	30.217
Mean annual rainfall for two years	7.68 inches.

Established July 16, 1876; observations commenced May 25, 1877.

Office, in Lemon's Building (adobé).

Private W. T. Miles was in charge until July 30; Sergeant S. W. Naylor, from July 30 to August 29, and Sergeant N. D. Lane, from August 29 to date. There is one assistant at this station.

Number of messages during the year.—Sent paid, 1,385; received paid, 1,432; sent free, 1,894; received free, 1,162; total, 5,873.

Receipts.—This line, $369.43; other lines, $211.83; sundry, $6.21; total, $587.47.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Four full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

The office is commodious and conveniently situated. Signals are consolidated here from the California, New Mexico, and Texas divisions, and sent to Denison. Next to Santa Fé this is the most important station on the line. It was inspected in May.

The repair section extends to Leasburg, 22 miles north; to Mason's Ranche, 24 miles west, and to Cottonwood's, 22 miles southeast.

LAS CRUCES, NEW MEXICO.

[*Official number*, 216.]

Latitude	32° 17′
Longitude	106° 46′

Established October 10, 1877.

The services of the operator being greatly needed elsewhere this office was closed June 20.

LOS LUNAS, NEW MEXICO.

[*Official number*, 217.]

Latitude	34° 53′
Longitude	106° 45′

Established December 20, 1876.

Civilian operator, W. M. Smith, was in charge until December 25; civilian operator, E. E. Simpson, from December 25 to June 25, and Private W. A. Merchant, from June 25 to date.

Number of messages during the year.—Sent paid, 1,640; received paid, 1,580; sent free, 618; received free, 253; total, 4,091.

Receipts.—This line, $604.46; other lines, $284.72; sundry, $6.30; total, $895.48.

The station is supplied with a complete set of telegraph instruments and repair tools.

There are no meteorological instruments at the station and no observations are taken.

A daily sunset report is forwarded by telegraph.

A branch office is in operation at Belen, 10 miles south. This is maintained without cost to the line.

During the past year the office has been supported by line receipts and contributions from citizens. The opening of a Western Union telegraph office at this point renders the establishment of a station here no longer necessary, and this one will probably be discontinued.

It was inspected in May.

SANTA FÉ, NEW MEXICO.

[*Official number*, 69.]

Latitude	35° 41′
Longitude	106° 10′
Elevation of barometer above mean sea-level	6,970.37 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for seven years	23.262
Mean annual barometer (reduced to sea-level) for eight years	29.800
Mean annual temperature for eight years	48°.7
Mean annual rainfall for eight years	14.70 inches.

Established November 20, 1871.

Office, Johnson's Building, east side of Public Plaza.

Sergeant Max Frost has remained in charge of the meteorological and clerical work of the station. Private E. C. Guthrie is assistant; Mr. William T. Adams, manager; Mr. J. L. Vreeland, clerk. Three assistants have been ordered to, and three relieved from, this station during the year.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Eight full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

Number of messages during the year.—Sent paid, 5,643; received paid, 6,312; sent free, 4,481; received free, 4,141; total, 20,577.

Receipts.—This line, $1,814.05; other lines, $7.78; sundry, $8; total, $1,829.83.

The office was inspected in May.

Extracts from the observer's semi-annual report:

> The press of Santa Fé, and in fact of the entire Territory, is very friendly to the service, and frequently very flattering and complimentary articles are published on both branches of the service—meteorological and telegraphic. Information on the climate of Santa Fé and the Territory has been furnished to a considerable extent to residents of the Territory.
>
> The reputation and general standing of the service among all classes of citizens of Santa Fé is excellent.

SHAKSPEARE, NEW MEXICO.

Established November 20, 1879.

Private Oscar D. Stewart was in charge from November 20 until March 1; civilian operator, A. E. Lindsay, from March 1 to June 20, and civilian operator, Robert Reeder, from June 20 to date.

Number of messages during the year.—Sent paid, 1,065; received paid, 694; sent free, 437; received free, 297; total, 2, 493.

Receipts.—This line, $346.83; other lines, $385.63; total, $732.46.

The station is supplied with a complete set of telegraph instruments and repair tools.

There are no meteorological instruments at the station and no observations are taken.

A daily sunset observation is forwarded by telegraph.

It has not been inspected.

SILVER CITY, NEW MEXICO.

[*Official number*, 194.]

Latitude	32° 48′
Longitude	108° 15′
Elevation of barometer above mean sea-level	5,796.00 feet.

Established May 15, 1878; observations commenced May 17, 1878.

Office, corner Yankie and Main streets.

Private Martin Hoover was in charge until February 1, when he was relieved by Private J. G. Frankenberg. There are two additional enlisted men on duty, one as assistant, the other as repair man. One assistant has been ordered to, and one relieved from, this station during the year.

Number of messages during the year.—Sent paid, 4,332; received paid, 3,810; sent free, 2,060; received free, 964; total, 11,166.

Receipts.—This line, $1,563.03; other lines, $1,572.87; sundry, $180.00; total, $3,315.90.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Four full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

The cash receipts at this office are very large and are a great aid to the line.

The station was inspected in May.

The repair section extends to Hot Springs, 31 miles southeast, and to Knight's Ranche, 30 miles southwest.

Burkes, Ariz	(*)		0	Observations of thermometer, hygrometer, direction of wind and state of weather, clouds, and rainfall taken three times a day.
Campo, Cal	(*)		1	Complete observations taken four times a day.
Camp Thomas, Ariz	April 1, 1880		1	Do
Fort Apache, Ariz	(*)		4	Do
Fort Grant, Ariz	(*)		4	Do
Fort Verde, Ariz	(*)		1	Complete observations, except barometric, taken four times a day.
Florence, Ariz	(*)		1	Complete observations taken four times a day.
Phœnix, Ariz	(*)		1	Do
Prescott, Ariz	(*)		4	Complete observations taken eight times a day.
San Diego, Cal	(*)		4	Do
Tucson, Ariz	(*)		4	Complete observations taken four times a day.
Wickenburg, Ariz	(*)		1	Complete observations, except barometric, taken four times a day.
Yuma, Ariz	(*)		4	Complete observations taken four times a day.

* Reporting at date of last annual report, June 30, 1879.

Report of stations on the United States military telegraph line, division of Arizona and California, compiled from the annual report of Lieut. Charles A. Booth, First United States Infantry, acting signal officer in charge, and from data on file in the office of the Chief Signal Officer.

APACHE (FORT APACHE), ARIZONA TERRITORY.

[*Official number*, 192.]

Latitude	33° 47′ 18″
Longitude	109° 57′ 52″
Elevation of barometer above mean sea-level	5,004.46 (?) feet.
Mean rainfall for the year ending June 30, 1880	19.30 inches.

Established October 9, 1877; observations commenced June 28, 1878.

Private Will C. Barnes, Signal Corps, U. S. A., is in charge. Private John J. Falvey was in charge until February 19, 1880, when he was relieved by Private Barnes. There is no assistant at this station.

Number of messages during the year.—Sent paid, 270; sent collect, 78; received paid, 240; received collect, 86; sent D. H., 964; received D. H., 1,028; total, 2,666. Free business, $684.38.

Receipts.—This line, $166.06, other lines, $56.00; total, $222.06.

This station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Four full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

The station was inspected on January 1, 1880, by First Lieut. J. P. Story, acting signal officer.

Extracts from the observer's semi-annual reports:

On the 20th day of April the instruments were removed from the building which had been used as an office since November 21, 1878, to the present location, which is better in many respects.

On the 9th of April, Private Falvey, while waiting orders here, accompanied Captain Kramer's command, Company E, Sixth Cavalry, as a scout to intercept Victoria and his band of hostiles at Ash Creek, about 40 miles from here. He took with him a key and relay, and each night, as the trail lay near the line, cut in and placed Captain Kramer in direct telegraphic communication with headquarters. On arrival at Ash Creek he opened a station in a tent, about a quarter of a mile from their camp, and for two weeks transmitted many important messages over the wires.

The military telegraph line is of great benefit to those in the post and the scattered settlements to the north and east of us. Parties frequently come in from Saint Johns and other places over a hundred miles from here to place themselves in communication with the telegraphic stations of the world.

Total	24

APACHE PASS (FORT BOWIE), ARIZONA TERRITORY.

[*Official number*, 211.]

Latitude	32° 8′
Longitude	109° 30′

Established May 4, 1877.

Office is in a one-story adobé building.

Sergeant William Baber was in charge of this station until September 28, 1879; Private J. M. Burlew, from September 28, 1879, to June 12, 1880, and Private C. M. Jameson, from June 12 to date.

Number of messages during the year.—Sent paid, 518; sent collect, 112; received paid, 428; received collect, 133; sent D. H., 964; received D. H., 1,028; total, 3,183. Free business, $343.42.

Receipts.—This line, $203.02; other lines, $119.65; total, $322.67.

This station is supplied with a partial set of meteorological instruments, and a complete set of telegraph instruments and repair tools. The meteorological instruments have not yet been put in position as the office building is much in need of repair. When these repairs are made the instruments will be placed in position and observations commenced.

The station has been inspected twice during the year—by Lieut. C. A. Booth, officer in charge, on October 15, 1879, and by Lieut. J. P. Story, acting signal officer, on January 8, 1880.

Extracts from the observer's semi-annual report:

During the Indian troubles the line is used to great advantage. All orders for movements of troops are transmitted by telegraph. The line is also used by the citizens to their advantage and fully appreciated by them.

BURKES, ARIZONA TERRITORY.

[*Official number*, 911.]

Latitude	32° 55′
Longitude	113° 20′
Mean annual rainfall for two years	4.77 inches.

Established and observations commenced December 5, 1877.

Office is in an adobé building.

Private E. I. Falconer was in charge until July 31; Private Frank Ridgway, from July 31 to February 23, 1880; Corporal Edmund Davis, from February 23 to April 6, and Private W. J. Croley, Company I, Sixth Cavalry, from April 6 to date. There is no assistant at this station.

Number of messages during the year.—Sent paid, 153; sent collect, 78; received paid, 147; received collect, 44; sent D. H., 304; received D. H., 21; total, 747. Free business, $69.83.

Receipts.—This line, $33.45; other lines, $0.78; total, $34.23.

The station is supplied with a partial set of meteorological instruments and a complete set of telegraph instruments and repair tools.

Observations of the hygrometer, thermometer, direction of wind and state of weather, clouds and rainfall are taken tri-daily and forwarded by mail, weekly. Sunset observations were reported by telegraph until April 5.

The most important duty at this station is to keep this section of the line in repair.

The station was inspected December 3, 1879, by First Lieut. J. P. Story, acting signal officer.

CAMPO, CALIFORNIA.

[*Official number*, 171.]

Latitude	32° 22′
Longitude	116° 8′
Elevation of barometer above mean sea-level	2,527.12 (?) feet.
Mean annual barometer (corrected for temperature and instrumental error only) for the year ending June 30, 1880	27.385
Mean annual rainfall for two years	14.53 inches,

Established January, 1874; observations commenced September 28, 1875.

Office, corner Grant avenue and Blaine street.

Sergeant W. U. Simons was in charge until February 2, 1880, when he was relieved by Private Thomas S. Collins, who still remains. There is no assistant at this station.

Number of messages during the year.—Sent paid, 63; sent collect, 25; received paid, 60; received collect, 21; sent D. H., 332; received D. H., 6; total, 507. Free business, $89.77.

Receipts.—This line, $26.51; other lines, $7.80; total, $34.31.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Meteorological observations are taken four times a day and forwarded to this office by mail weekly. Sunset observations are forwarded daily by telegraph.

The station was inspected August 7, 1879, by Lieut. C. A. Booth, officer in charge, and by Lieut. J. P. Story, acting signal officer, on November 26, 1879. It is located near the boundary line, and the telegraph affords quick means of applying for assistance when the place is threatened by border ruffians, which is not infrequent, and saves the government the expense of keeping a garrison for the protection of the farmers and citizens.

Extracts from the observer's semi-annual report:

> The only interest taken in the service at this point is in regard to the telegraph office and the facilities it affords for communication with the civil and military author-

ities, in case of an incursion of bandits or Indians across the line of the United States and Mexico, enabling the business men here to summon aid in case the raiding party is too large to be repulsed by the force at hand. The fact of speedy means of communication gives a feeling of security that would not prevail were the telegraphic facilties removed, and the only regret of the settlers is that there is not more commercial business done here to recompense the government for the great benefit the community derives from the line.

GRANT (FORT GRANT), ARIZONA TERRITORY.

[*Official number*, 182.]

Latitude	32° 25′
Longitude	109° 56′
Elevation of barometer above mean sea-level	4,737.00 (?) feet.
Mean annual barometer (corrected for temperature and instrumental error only) for the year ending June 30, 1880	25.215
Mean rainfall for the year ending June 30, 1880	13.30 inches.

Established November 1, 1875; observations commenced July 14, 1877.

Office, Headquarters' Building, north corner of the fort.

Private Fred. C. Kelly was in charge until August 1, 1879, when he was relieved by Private Thomas Gibson, who still remains. Private A. C. Linderkrantz is on duty as repair-man.

Number of messages during the year.—Sent paid, 508; sent collect, 116; received paid 348; received collect, 160; sent D. H., 1,516; received D. H., 968; total, 3,616. Free business, $1,164.60.

Receipts.—This line, $210.50; other lines, $111.50; total $322.00.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Four full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the entral office.

The station has been inspected twice during the year—by Lieut. C. A. Booth, officer in charge, October 17, 1879, and by Lieut. J. P. Story, acting signal officer, January 6, 1880.

Extracts from the observer's semi-annual report:

> During the past year the United States military telegraph line has been of incalculable value to the public at large, and to the military authorities in particular. During the late Indian outbreaks commanding officers have frequently established their headquarters in telegraph offices, and through the medium of the operators have transmitted orders and directed the movement of troops as well as if they had been present at any point communicated with. By means of the telegraph it has been possible to quickly concentrate the forces, to aid and protect the settlements, and to engage or pursue the hostiles. The prompt and efficient aid rendered the military authorities by the operators, in movements of troops, supplies, &c., shows the value of the line.

Mean annual barometer (reduced to sea-level) for the year ending June 30, 1880	30.122
Mean annual rainfall for four years	13.73 inches.

Established November 19, 1873; observations commenced November 28, 1875.

Office, Old Headquarters' building.

Sergeant John J. Nanry has been in charge during the year. Private James E. Hayes was assistant until September 8, 1879; J. S. Hunter, civilian, was employed until January 31, 1880, when he was succeeded by George P. Men Muir, who still remains. Private Voules, Company K, Sixth Cavalry, is repair-man. Miss G. A. McClintock is in charge of the branch office in the city.

Number of messages during the year.—Sent paid, 2,794; sent collect, 869; received paid, 2,757; received collect, 1,417; sent D. H., 6,718; received D. H., 4,862; total, 19,417. Free business, $3,391.52.

Receipts.—This line, $1,373.16; other lines, $4,461.53; total, $5,834.69.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Eight full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

The station was inspected by Lieut. C. A. Booth, officer in charge, September 19, 1879, and by Lieut. J. P. Story, acting signal officer, December 8, 1879.

SAN CARLOS AGENCY, ARIZONA TERRITORY.

Latitude	33° 9′
Longitude	110° 9′

Established December 6, 1879.

Private Robert C. Lord, Company H, Twelfth Infantry, is repair-man, and in charge. All of the business of this office during the year, both free and commercial, has been checked against, and accounted for, by Camp Thomas office.

Telephones were used between these stations until May 1, 1880, when telegraph instruments were substituted.

The station is supplied with a complete set of telegraph instruments and repair tools.

There are no meteorological instruments at the station, and no observations are taken.

This station has not been inspected.

SAN DIEGO, CALIFORNIA.

[*Official number*, 75.]

Latitude	32° 32′
Longitude	117° 8′
Elevation of barometer above mean sea-level	67.12 feet.

Mean annual barometer (corrected for temperature and instrumental error only) for two years	29.937
Mean annual barometer (reduced to sea-level) for eight years	30.012
Mean annual temperature for eight years	60°.6
Mean annual rainfall for eight years	9.97 inches.

Established November 1, 1871.

Office, Corner D and Fifth streets.

At this station are the headquarters of the officer in charge of the California and Arizona division United States military telegraph line. Lieut. C. A. Booth is in charge; Sergeant Martin L. Hearne is chief clerk to officer in charge; Sergeant W. H. Clendenon is in charge of the meteorological work; Lance Sergeant William Story is in charge of the operating room; Clarence E. Hubon is civilian messenger, and Henry T. Bradt is janitor and battery man. Private J. H. McKenna was relieved from this station March 13, 1880.

Number of messages during the year.—Sent paid, 544; sent collect, 512; received paid, 844; received collect, 224; sent D. H., 1,418; received D. H., 414; total, 3,956. Free business, $483.10.

Number of words sent and received on business connected with the government and maintenance of the line.—Sent, 50,641; received, 58,550; total, 109,191.

This station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Eight full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

A great deal of interest is manifested here in the meteorological reports, and especially in the record of rainfall, by farmers, as the amount of rain during the winter months is an index of what the crops will be the ensuing season.

The office is regularly visited by the meteorological committee of the San Diego Society of Natural History.

The station was inspected by Lieut. John McClellan, acting signal officer, October 6, 1879, and by Lieut. J. P. Story, acting signal officer, November 23, 1879.

Extracts from the observer's semi-annual reports:

> The newspapers of this place publish daily and monthly reports of the observations taken at this station, together with those received by telegraph. The operations of the service continue to attract a fair share of attention, both from residents of the city and vicinity and strangers, and the office is often visited from motives of either curiosity or a desire for information. As this port possesses very little commerce, not much can be said of the service in this connection.

THOMAS (CAMP THOMAS), ARIZONA TERRITORY.

[*Official number*, 212.]

Latitude	32° 4′ 14″
Longitude	110° 5′ 37″

Established September 22, 1877; observations commenced April 1, 1880.

Private John T. Fitzgerald has been in charge throughout the year. There is no assistant at this station.

Number of messages during the year.—Sent paid, 1,160; sent collect, 164; received paid, 770; received collect, 274; sent D. H., 1,516; received D. H., 968; total, 4,852. Free business, $855.93.

Receipts.—This line, $525.54; other lines, $138.82; total, $664.36.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Meteorological observations are taken four times a day and forwarded by mail weekly.

A daily sunset observation is forwarded by telegraph.

The station was inspected by Lieut. C. A. Booth, officer in charge, October 21, 1879, and by Lieut. J. P. Story, acting signal officer, December 25, 1879.

Extracts from the observer's semi-annual reports:

> The great convenience and utility of the telegraph line has been clearly demonstrated during the recent raid made into this section of the country by hostile Indians.
>
> The telephones on the San Carlos line worked well for two or three months, but then gradually failed, until at last they became entirely useless, and were replaced by Morse instruments.
>
> The necessary material having been furnished by the Signal Service the post commander had a suitable building for an office erected. It consists of two rooms, one 12 feet by 8 for office, and the other 12 by 12 for store-room. The building was occupied October 3, 1879.

Receipts.—This line, $108.96; other lines, $112.52; total, $221.48.

This station is supplied with a partial set of meteorological instruments and a complete set of telegraph instruments and repair tools.

Meteorological observations are taken four times a day and forwarded weekly by mail.

A daily sunset observation is forwarded by telegraph.

The station was inspected by Lieut. C. A. Booth, officer in charge, September 17, 1879, and by Lieut. J. P. Story, acting signal officer, December 6, 1879.

The station was temporarily closed from August 7 to September 11, 1879.

Extracts from the observer's semi-annual report:

> The utility of the telegraph line was signally demonstrated during the military operations against the Chemjuevis Indians in May last, when this line became the principal medium of communication between the department commander at Prescott and his subordinates and agents in the field and at this point. Full instructions and lengthy detailed reports of operations were exchanged at short intervals, enabling all parties to act with promptness and intelligence, and thus avert what threatened to be a bloody Indian war.

Number of messages since opening of station.—Sent paid, 1,646; sent collect, 324; received paid, 291; received collect, 464; sent free, 1,014; received free, 481; total, 4,220.

Receipts.—This line, $901.35; other lines, $834.08; total, $1,735.43. Free business, $330.00.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Four full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

The station has not been inspected.

This station maintains in repair 40 miles of wire.

BISMARCK, DAKOTA TERRITORY.

[*Official number*, 104.]

Latitude	46° 48′
Longitude	100° 38′
Elevation of barometer above mean sea-level	1,704.33 feet.
Mean annual barometer (corrected for temperature and instrumental error only) for five years	28.149
Mean annual barometer (reduced to sea-level) for five years	29.905
Mean annual temperature for five years	39°.8
Mean annual rainfall for five years	23.80 inches.

Established September 15, 1874.

Office, corner First and Meigs streets.

At this station are the headquarters of the officer in charge of this division.

Sergeant Cyrus Cramer is in charge of the station. He has two assistants. Eight assistants have been ordered to, and eight relieved from, this station during the year.

The station is supplied with a complete set of meteorological and telegraph instruments and repair tools.

Eight full meteorological observations are taken daily. The three regular telegraphic and sunset observations are forwarded to the central office.

Number of messages during the year.—Sent paid, 2,610; sent collect, 1,226; received paid, 5,038; received collect, 1,024; sent free, 2,910; received free, 10,336; total, 23,144.

Receipts.—This line, $1,727.85; other lines, $40.16; total, $1,768.01. Free business, $1,604.02.

The station maintains in repair 35 miles of wire.

There has been no formal inspection of this station.

Extracts from the observer's semi-annual reports:

> Weekly reports and the monthly means are furnished the local weekly paper and generally published. Items are also furnished and published from time to time.
>
> A general interest is taken in the service. The reports are relied on and inquiries are frequently made of the prospects of the weather. Instruments are sometimes brought for comparison and adjustment.
>
> The river reports are also valuable to steamboat men, one of whom informed me that a single report was sometimes worth hundreds of dollars.

The station at Lewes was transferred to Delaware Breakwater January 27, 1880.
Pensacola became a station of the first class October 27, 1879.

The following is the record of the display stations for the year ending June 30, 1880:

ASHTABULA HARBOR, OHIO.

Established August 1, 1878.

Displayman, Mr. W. O. Nettleton.

Signals are displayed from a staff placed against the southwest corner of Mr. Nettleton's store, which stands about sixty-five feet above, and about two hundred yards from, the lake. The view of the signals from the lake is unobstructed, except from the west, where it is cut off by a high bluff. Vessels coming from that direction can see the signals when within three miles of the harbor entrance, giving them ample time to run in if they should desire to do so.

The Western Union Telegraph office is in Mr. Nettleton's store.

The station has not been inspected during the year.

BAY CITY, MICHIGAN.

Established August 1, 1878.

Displayman, Mr. James Roberts.

Signals are displayed from a staff placed on the roof of a three-story building near the bridge. The situation is a good one, as the signals can be seen from all parts of the river nearly up to Saginaw and the anchorage ground in the bay.

BOOTH BAY, MAINE.

Established August 20, 1878.

Displayman, Mr. John O'Brien.

Signals are displayed from a staff on a hill about a quarter of a mile southeast of the telegraph office. The top of the staff is about two hundred and twenty-five feet above low water. The signal is visible from all parts of the harbor, and from some distance out at sea.

The station has not been inspected during the year.

CAPE VINCENT, NEW YORK.

Established August 1, 1878.

Displayman, Mr. C. C. Brown.

Signals are displayed from a staff about twenty-five feet from the telegraph office, on the R. W. and O. wharf, and are visible to all vessels passing into and out of Lake Ontario; those using the American channel passing within three-quarters of a mile of the wharf.

The station has not been inspected during the year.

CHARLEVOIX, MICHIGAN.

Established August 1, 1879.

Displayman, Mr. W. A. Smith.

The station has not been inspected since its establishment.

CHARLOTTE, NEW YORK.

Established August 1, 1878.

Displayman, Mr. A. J. Mulligan.

Signals are displayed from a staff thirty-five feet high, on the roof of a two-story building used as a custom-house and post-office. The building is forty-five feet high, making the height of the signal above ground eighty feet. The signal may be seen from all parts of the harbor, and at the lake shore, which is half a mile distant. When the station was first established Mr. G. W. Allen was employed as displayman, but was soon after succeeded by Mr. A. J. Mulligan.

The station has not been inspected during the year.

CHATHAM, MASSACHUSETTS.

Established August 15, 1878.

Displayman, Mr. C. S. Nickerson.

Signals are displayed from a staff sixty feet in height, situated on a hill about seventy-five yards from the post-office and telegraph office. The view of the signal is unobstructed from all directions for several miles. Vessels bound between New York and Boston usually pass within sight of the signal.

The station has not been inspected during the year.

CITY ISLAND, NEW YORK.

Established February 1, 1879.

Displayman, Mr. H. B. Roberts.

The station has not been inspected during the year.

DEER ISLAND, MAINE.

Established April 1, 1879.

Displayman, Mr. F. H. Gross.

Signals are displayed from a staff about one hundred feet high, which stands near the head of the harbor, and but a few yards from the beach.

The harbor is a long, narrow strip of water, surrounded by high hills. The signal can only be seen for a few minutes by passing vessels.

The station has not been inspected during the year.

DUNKIRK, NEW YORK.

Established August 1, 1878.

Displayman, Mr. S. T. Blakeney.

Signals are displayed from a staff on the roof of the opera house, which is one block from the lake and about two blocks from the steamboat landing.

The building is one of the most prominent in the town, and the signal can be seen for several miles from the lake in all directions.

The station has not been inspected during the year.

EAST TAWAS, MICHIGAN.

Established August 1, 1878.

The display of signals at this point is under the charge of Miss Estella C. French.

Signals are displayed from a staff about eighty feet high, near the end of the wharf, and are visible from all parts of Tawas Bay, and for some distance out on Saginaw Bay.

The station has not been inspected during the year.

FAIRPORT, OHIO.

Established August 28, 1878.

Displayman, Mr. A. P. Sanford.

Signals are displayed from a staff on the west end of the roof of a warehouse near the entrance to the harbor, and about one hundred yards from the lake. Signals can be seen from all directions on the lake, and several miles out.

The station has not been inspected during the year.

FALL RIVER, MASSACHUSETTS.

Established October 18, 1878; discontinued May 12, 1879; re-established February 17, 1880.

Displayman, Mr. W. G. Bennett.

Signals are displayed from a staff on the tower of a five-story building. The top of the staff is about two hundred and fifty feet above tidewater. The signal is visible for at least ten miles in the direction of Newport, farther from the westward, and by vessels bound out from Providence. Mr. Bennett is a prominent druggist, whose store is in the building from which signals are displayed.

The station has not been inspected during the year.

FORESTER, MICHIGAN.

Established August 1, 1878.

Displayman, Mr. F. T. Smith.

Signals are displayed from a staff on the roof of a large flouring mill near the end of the wharf, and one hundred and fifty yards from the telegraph office. The top of the staff is about ninety feet above the water, and, as the shore here runs nearly north and south, the signal is very prominent.

The station has not been inspected during the year.

FRANKFORT, MICHIGAN.

Established July 20, 1878.

Displayman, Mr. C. S. Collier.

Signals are displayed from a staff which stands a few yards from and in front of the telegraph office on Main street. The signal may be seen from all parts of the harbor, and from the lake in all directions except the northwest, where the view is obstructed by a high bluff.

The station has not been inspected during the year.

GLOUCESTER, MASSACHUSETTS.

Established September 25, 1878.

Displayman, Mr. Edward McQuinn.

Signals are displayed from a staff on the roof of the custom-house, and are visible for several miles seaward. Mr. McQuinn reports that the display of signals at this place has been of great service to the fishermen, and that since the establishment of the station they have been guided to a great extent by them.

The station has not been inspected during the year.

GREEN BAY, WISCONSIN.

Established September 16, 1877.

Displayman, Mr. David Soper.

Signals are displayed from a staff on the roof of the elevator of the Chicago and Northwestern Railroad in Fort Howard, across the river from Green Bay. The signals are visible for miles in every direction. Mr. Soper reports that the signals are growing in favor with vessel-men, very few captains being willing to go out when the signal is up.

The station was inspected July 11, and found in excellent condition.

HIGHLAND LIGHT, MASSACHUSETTS.

Established August 15, 1878.

Displayman, Mr. Isaac M. Small.

Signals are displayed from a staff a few feet from the north end of the telegraph office, which is fifty yards from the edge of the cliff and three hundred yards from the light-house. Signals can be seen from a great distance in all directions, except the south; they are also plainly visible from all parts of the harbor at Provincetown. It is estimated that fifty thousand vessels pass this station each year, and as there is a good harbor, easy of access, at Provincetown, the display of signals must be of great benefit to shipping.

The station has not been inspected during the year.

HORN'S PIER, WISCONSIN.

Established March 15, 1878.

Displayman, Mr. W. H. Horn.

Signals are displayed from a staff which stands near the corner of Mr. Horn's store, about one hundred yards from the lake. The signals are visible from the lake in all directions, and for some distance out.

The station was inspected July 10, and found in excellent condition.

HOUGHTON, MICHIGAN.

Established August 1, 1879.

Displayman, Mr. J. R. Dee.

Cautionary signals are sent direct from this office.

The station has not been inspected since its establishment.

HYANNIS, MASSACHUSETTS.

Established August 15, 1878.

Displayman, Mr. Isaac M. Small.

Signals are displayed from a staff near the light-house, about one and a half miles southwest of the telegraph office and in the center of the town.

The station has not been inspected during the year.

KENOSHA, WISCONSIN.

Established September 16, 1877.

Displayman, Mr. R. H. Simmons.

Signals are displayed from a staff on the building of the Northwestern Telegraph Company.

The station was inspected July 5, and found in good condition.

KEWAUNEE, WISCONSIN.

Established September 16, 1877.

Displayman, Mr. A. D. Laughlin, P. M.

Signals are displayed from a staff which stands in front of the post-office, and about two blocks from the wharf. Signals are visible from all parts of the wharves and the lake.

The station was inspected July 9, and found in excellent condition.

LEWES, DELAWARE.

Established February 25, 1878.

Displayman, Mr. C. M. Marshall.

On April 1 this station was discontinued and property transferred to Delaware Breakwater, where a station of the Signal Service had been established.

LUDINGTON, MICHIGAN.

Established January 20, 1878.

Displayman, Mr. H. F. Alexander.

Signals are displayed from a staff that stands near the corner of Mr. Alexander's store; they are visible from all parts of the harbor, and from the lake in all directions for several miles out.

The station has not been inspected during the year.

MACKINAC CITY, MICHIGAN.

Established October 4, 1878.

Displayman, Mr. J. F. Simpson.

The flags are displayed from a staff which consists of a large pine tree, from which the branches have been cut, and a pine staff about twenty feet long fastened to the top. The top of the staff is about ninety feet above the ground, thus bringing the flag above the surrounding trees, and making it visible from all parts of the straits. The lantern, when signals are displayed at night, is placed on a platform on the top of Mr. Simpson's barn, which stands a short distance from the staff. The elevation of the lantern is sufficient to make the light visible to all passing vessels.

The station has not been inspected during the year.

MANITOWOC, WISCONSIN.

Established September 16, 1877.

Displayman, Mr. W. W. De Lano.

Signals are displayed from a staff on the roof of a building, at the end nearest the river, of the Eighth-street bridge. Signals can be seen from all parts of the harbor, and from the lake for a long distance out.

The station was inspected July 9, and found in good condition.

MARBLEHEAD, MASSACHUSETTS.

Established August 15, 1878.

Displayman, Mr. Frank Dodge.

Signals are displayed from a staff that stands a few yards north of Abbot Hall, which is on a hill overlooking the town. As the top of the staff is one hundred and twenty-seven feet above the ground, the signal can be seen for several miles from all directions. The fishing grounds are within sight of the signal, and Mr. Dodge states that a display of the "off-shore" signal is invariably followed by a return of the fishing fleet to port.

The station has not been inspected during the year.

MENOMONEE, MICHIGAN.

Established September 16, 1877.

Displayman, Mr. N. Gram.

Signals are displayed from a staff on the top of the engine-house, which stands a few yards from the beach, and may be seen from all points of the harbor.

The station was inspected July 12, and found in good condition.

MONROE, MICHIGAN.

Established August 1, 1878.

Displayman, Mr. J. J. Hubbell.

Signals are displayed from a staff on the roof of a four-story house in the central part of the town; the building is about a mile from the lake. The signal is visible for several miles out on the lake, and must be seen by all vessels passing, except those that keep close to the north shore.

The station has not been inspected during the year.

MUSKEGON, MICHIGAN.

Established February 15, 1879.

Displayman, Mr. Lafayette Freeman.

Signals are displayed from a staff on the roof of the Mason building, one of the most prominent in the town. Signals can be seen from all parts of the harbor, and from Lake Michigan for some distance.

The station has not been inspected during the year.

NEW BEDFORD, MASSACHUSETTS.

Established August 15, 1878.

Displayman, Mr. G. A. Gifford.

Signals are displayed from a staff on the end of the building in which Mr. Gifford's office is situated, and is on the dock near the foot of School street. The view of the signal is unobstruced from all parts of the harbor, and for several miles seaward. The display of signals at this station has been reported as being of great interest to the shipping, and they have been generally heeded by vessel masters. The city papers publish all signal orders.

The station has not been inspected during the year.

NEWBURYPORT, MASSACHUSETTS.

Established August 15, 1878.

Displayman, Capt. John W. Sargent.

Signals are displayed from a staff on the top of the custom-house. It stands on the dock, and there is nothing to obstruct the view of the signals from the harbor or from the sea beyond. It is reported that the fishermen closely watch the signals, and as they can be plainly seen from their fishing ground, they generally run in when one is hoisted.

The station has not been inspected during the year.

NORTHPORT, MICHIGAN.

Established July 20, 1878.

Displayman, Mr. W. Gill, P. M.

Signals are displayed from a staff in the rear of Mr. Gill's store. The telegraph office is but a short distance away. The view of the signal is unobstructed from all parts of the harbor, and may be distinctly seen with a glass from the opposite side of the bay.

The station has not been inspected during the year.

PENSACOLA, FLORIDA.

Established November 10, 1878.

Displayman, Mr. James Brown, jr.

Discontinued as a display station October 1, 1879, a station of the Signal Service having been established at this point on the above date.

PENTWATER, MICHIGAN.

Established July 20, 1878.

Displayman, Mr. M. A. Rice.

Signals are displayed from a staff immediately in front of the telegraph office, about one hundred yards from the harbor, and can be seen from all parts thereof. A high bluff extends along the lake shore, in front of the town, and cuts off all view of the signals from passing vessels, except during the time they are going by the entrance to the harbor. Mr. Rice reports that the display signals at this station are growing more and more popular.

The station has not been inspected during the year.

PORT AUSTIN, MICHIGAN.

Established August 1, 1878.

Displayman, Mr. Philip Winsor.

Signals are displayed from a staff which stands a few yards from the store of Messrs. Carrington & Winsor. Signals may be easily seen by vessels bound in and out of the bay.

The station has not been inspected during the year.

PORT EADS, LOUISIANA.

Established October 10, 1878.

Displayman, Mr. F. C. Welschhans.

Signals are displayed from a tower one hundred and ten feet above ground. This station is one hundred and five miles below New Orleans, on the east bank of the South Pass of the Mississippi River, two miles from the bar, and three miles from the head of the pass.

This station has not been inspected during the year.

PORTSMOUTH, NEW HAMPSHIRE.

Established August 20, 1878.

Displayman, Mr. G. H. Nutter.

Signals are displayed from a staff on the building next to the corner of Daniel and Market streets. The view of the signal is unobstructed from the harbor and its entrance, and at times may be seen from the Isle of Shoals.

The station has not been inspected during the year.

PROVINCETOWN, MASSACHUSETTS.

Established September 1, 1879.

Displayman, Mr. A. M. Kemp.

The station has not been inspected since its establishment.

RACINE, WISCONSIN.

Established September 16, 1877.

Displayman, Mr. G. W. Scanlon.

The signal is displayed from a staff on the roof of the warehouse of the Goodrich Steamboat Company, which is on the dock at the harbor entrance. The signal is visible from all parts of the harbor, and for a long distance out on the lake.

The station was inspected July 7, and found in good condition.

ROCKLAND, MAINE.

Established June 1, 1879.

Displayman, Mr. W. H. Waltham.

The station has not been inspected since its establishment.

ROGERS CITY, MICHIGAN.

Established August 1, 1878.

Displayman, Mr. Henry Clothier.

Signals are displayed from a staff a few yards south of the telegraph office, which is about seventy-five yards from the wharf. The usual course of passing vessels is within five miles of this station. Owing to the background of pine trees, signals are not easily distinguished by the naked eye, but can be easily seen with a glass from the vessels. The telegraph line along the eastern shore of Michigan, for a great part of the way, passes through pine timber, and is frequently broken by falling trees.

The station has not been inspected during the year.

SAINT JOSEPH, MICHIGAN.

Established August 10, 1878.

Displayman, Mr. J. H. King.

Signals are displayed from a staff situated on the roof of the Lake House, which stands on a high bluff near the lake. The view of the signal is unobstructed from all directions.

The station has not been inspected during the year.

SAND BEACH, MICHIGAN.

Established September 20, 1879.

Displayman, Mr. R. W. Irwin.

This station has not been inspected since its establishment.

SHEBOYGAN, WISCONSIN.

Established September 16, 1877.

Displayman, Mr. J. L. Mallery.

The staff stands near the post-office, and is the property of the Signal Service.

The station was inspected July 8, and found in good condition.

SOUTH HAVEN, MICHIGAN.

Established August 10, 1878.

Displayman, Captain J. S. Donahue.

Signals are displayed from a staff upon a high bluff in the rear of the light-house, immediately at the entrance to the harbor, and are visible for miles on the lake.

The station has not been inspected during the year.

STONINGTON, CONNECTICUT.

Established August 10, 1878.

Displayman, Mr. S. O. Pendleton.

Signals are displayed from a staff in the northwest corner of the yard of the light-house, and can be seen for several miles from every direction. Mr. Pendleton has had a telegraph line put up between the light-house and the telegraph office, over half a mile distant. He states that coasters pay a great deal of attention to the signals, seldom leaving port, and often coming in, when one is displayed.

The station has not been inspected during the year.

STURGEON BAY, WISCONSIN.

Established September 16, 1877.

Displayman, Mr. T. A. Pieplow.

Signals are displayed from a staff near Leonhardt Music Hall, and about a block east of the telegraph office, which is two blocks from the wharf. The signals are visible from the harbor of refuge, at the Lake Michigan end of the canal, and also from Green Bay.

The station was inspected July 10, and found in good condition.

TRAVERSE CITY, MICHIGAN.

Established July 20, 1878.

Displayman, Mr. S. C. Fuller.

Signals are displayed from a staff on the roof of the post-office building, and can be seen from all parts of the bay. The telegraph office is in the same building.

The station has not been inspected during the year.

TYBEE ISLAND, GEORGIA.

Established February 15, 1879.

Displayman, Mr. H. J. Valleau.

The station has not been inspected during the year.

Table showing the location of the special river stations, east of the Rocky Mountains, reporting to the Chief Signal Officer, the names of the observers, the date at which each began reporting originally, and the highest and lowest water at each during the year ending June 30, 1880.

	Stations.	Rivers.	Name of observer.	Commenced reporting.	Highest water.		Date of highest water.	Lowest water.		Date of lowest water.

* Water below bench-mark.

Observations are taken at these stations during the rainy season, and when the water approaches the danger-line reports of the depth of the same are telegraphed daily to certain designated stations on the lower waters of the rivers on which they are located, and continued until danger to property along the banks is passed. Mail reports are also forwarded weekly to this office.

WEST INDIAN STATIONS.

BRIDGETOWN, BARBADOES.

[*Official number*, 8.]

Latitude	13° 4′ 12″
Longitude	59° 37′ 0″
Elevation of barometer above mean sea-level	22.0 feet.

Observer, Mr. Edwin Racker.

The office is in the second story of the observer's residence.

Two observations were taken daily from August to October, at hours synchronous with those at which the a. m. and p. m. observations are taken at Washington, and forwarded to this office by telegraph.

The station was inspected in April, and the observer found to be well informed in regard to his duties. The barometers were cleaned, and such instructions as were necessary in regard to the care of instruments, rendition of reports, &c., were given.

HAVANA, CUBA.

[*Official number*, 100.]

Latitude	23° 9′ 24″
Longitude	82° 22′ 0″
Elevation of barometer above mean sea-level	21.6 feet.

Observer, Mr. Charles H. Hasselbrink.

The office is in the second story of the observer's residence.

Three observations have been taken daily at hours synchronous with those at which the a. m., p. m., and midnight observations are taken at Washington. Two of these observations, the a. m. and p. m., have been telegraphed to this office. The three observations have been forwarded by mail weekly. Through the courtesy of Mr. H. C. Hall, consul-general, all reports from this station are forwarded in the consular mail.

The station was inspected in March, and found in good condition. The observer was found to understand his duties, and to be very attentive to them. The barometers were cleaned, and such suggestions and instructions in regard to care of instruments, rendition of reports, &c., as were necessary were given.

KINGSTON, JAMAICA.

[*Official number*, 4.]

Latitude	17° 58′ 0″
Longitude	76° 47′ 30″
Elevation of barometer above mean sea-level	30.2 feet.

Mr. James Gall is nominally in charge of this station, and responsible for the property and for the proper performance of the duties. Mr. Alfred Stewart, in the employ of Mr. Gall, is the meteorological observer. The office is in the Myrtle Bank building.

Two observations have been taken daily during the year at hours synchronous with those at which the a. m. and p. m. observations are taken at Washington, and forwarded to this office by telegraph. Weekly reports are also forwarded by mail.

The station was inspected in May, and found in an unsatisfactory condition. The observer did not understand the proper method of per-forming many of his duties. The instruments were cleaned, and in some instances given a better exposure. The observer was instructed thoroughly as to the manner in which his duties were performed.

On June 1 a station was established at Park Lodge by Mr. Maxwell Hall, who had visited this office and obtained the necessary instructions in regard to conducting the work.

The a. m. and p. m. observations are telegraphed to this office daily. These are taken at hours synchronous with 7 a. m. and 3 p. m., Washington mean time. The additional observations are also taken and forwarded to this office by mail. The 11 p. m. (Washington mean time) observation will be telegraphed to this office when the necessary arrangements can be made with the telegraph company.

This is the first of a number of stations that it is proposed to establish in the West Indies under the direction of Mr. Maxwell Hall.

NAVASSA ISLAND.

[*No official number.*]

Latitude	18° 25′
Longitude	75° 3′
Elevation of barometer above mean sea level	77.3 feet.

Observer, Mr. F. M. Everett.

Two observations have been taken daily during the year, at hours synchronous with those at which the a. m. and p. m. observations are taken at Washington, and forwarded to this office weekly by mail.

The station has not been inspected.

POINT-A-PITRE, GUADELOUPE.

[*Official number*, 9.]

Latitude	16° 3′
Longitude	61° 30′
Elevation of barometer above mean sea-level	20.0 feet.

Observer, Mr. L. V. Bigard.

Two observations were taken daily during the months of September and October at hours synchronous with those at which the a. m. and p. m. observations were taken at Washington, and forwarded to this office by telegraph.

The station has not been inspected.

SAINT THOMAS, S. T.

[*Official number*, 102.]

Latitude	18° 20′ 24″
Longitude	64° 55′ 45″
Elevation of barometer above mean sea-level	12.5 feet.

Observer, Mr. G. O. Gyllich.

The office is in the residence of the observer.

Two observations were taken daily during August, September, and October at hours synchronous with those at which the a. m. and p. m. observations were taken at Washington, and reported to this office by telegraph. Mail reports were also received for the above months.

The station was inspected in April, and found in an unsatisfactory condition. The instruments were poorly exposed, the reports improperly transmitted, and no records kept at the station. Miss Gyllich, daughter of the observer, was found to be familiar with the duties, and was placed in charge of the meteorological work of the station.

SANTIAGO DE CUBA, CUBA.

[*Official number*, 3.]

Latitude	19° 55′
Longitude	75° 50′
Elevation of barometer above mean sea-level	7.05 feet.

Mr. T. W. Beattie is in charge of the station. Mr. Robert Mason attends to the meteorological duties.

The office is in the warehouse of Brooks & Co.

Two observations were taken daily during the months of August, September, and October at hours synchronous with those at which the a. m. and p. m. observations were taken at Washington, and reported to this office by telegraph. Mail reports were also forwarded weekly.

The station was inspected in April, and found in a satisfactory condition. The observer was familiar with, and attentive to, his duties.

BRITISH-AMERICAN STATIONS.

SAINT JOHN'S, NEWFOUNDLAND.

[*Official number*, 10.]

Latitude	44° 17′
Longitude	66° 3′
Elevation of barometer above mean sea-level	150.0 feet.

The Hon. John Delaney continues to report by mail (weekly) to this office. Three daily observations are taken by him, two of which, the a. m. and p. m., are taken at hours synchronous with those at which the Washington observations are taken.

SAINT ANDREWS, NEW BRUNSWICK.

[*Official number*, 193.]

Latitude	45° 4′ 3″
Longitude	67° 3′ 0″
Elevation of barometer above mean sea-level	45.0 feet.

Observer, Dr. Gove.

Three observations are taken daily, at hours simultaneous with the telegraphic series of the United States, and forwarded to this office by mail weekly.

STAYNER, ONTARIO.

[*Official number*, 128.]

Latitude	44° 25′
Longitude	80° 15′
Elevation of barometer above mean sea-level	714.0 feet.

Two observations were taken daily, except Sunday, simultaneous with the a. m. and p. m. telegraphic series of the United States, from July 1 to August 2, 1879, since which time no reports have been received.

YORK FACTORY, HUDSON'S BAY TERRITORY.

[*Official number*, 11.]

Latitude	57° 2′
Longitude	92° 26′
Elevation of barometer above mean sea-level	45.00 feet.

Observers, J. Fortescue and W. Wood.

Four observations have been taken daily, one at 7 a. m., 2 p. m., and 9 p. m., local time, respectively, and one synchronous with 7.35 a. m., Washington mean time, and forwarded to this office, by mail, on weekly forms.

EDMONTON, NORTHWEST TERRITORY.

Latitude	53° 31′
Longitude	113° 38′

Three observations were taken daily, at hours simultaneous with the United States telegraphic series, and reported tri-daily by telegraph from December 29, 1879, to April 25, 1880, after which date they were discontinued.

PRINCE ARTHUR'S LANDING, ONTARIO.

Latitude	48° 27′
Longitude	89° 12′

Three observations were taken daily, at hours simultaneous with the United States telegraphic series, and reported tri-daily by telegraph from November 13, 1879, to April 30, 1880, on which date reports were discontinued.

BATTLEFORD, NORTHWEST TERRITORY.

Latitude	52° 41′
Longitude	108° 30′

Three observations were taken daily, at hours simultaneous with the United States telegraphic series, and reported tri-daily by telegraph from November 24, 1879, to April 25, 1880, on which date reports were discontinued.

HUMBOLDT, NORTHWEST TERRITORY.

Latitude	52° 11′
Longitude	105° 12′

Three observations were taken daily, at hours simultaneous with the United States telegraphic series, and reported tri-daily by telegraph from November 14, 1879, to April 25, 1880, on which date reports were discontinued.

DOMINION OF CANADA.

Telegraphic reports have been regularly received during the year from the stations named below, after concentration at the central office of the Dominion meteorological system in Toronto:

CHATHAM, NEW BRUNSWICK.

[*Official number*, 2.]

Latitude	47° 1′
Longitude	65° 30′
Elevation of barometer above mean sea-level	56.0 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

FATHER POINT, QUEBEC.

[*Official number*, 5.]

Latitude	48° 31′ 25″
Longitude	68° 27′ 40″
Elevation of barometer above mean sea-level	20.0 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

FORT GARRY, MANITOBA.

[*Official number*, 88.]

Latitude	49° 52′
Longitude	97° 0′
Elevation of barometer above mean sea-level	754.0 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

HALIFAX, NOVA SCOTIA.

[*Official number*, 89.]

Latitude	44° 39′ 20″
Longitude	63° 39′ 40″
Elevation of barometer above mean sea-level	122 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

KINGSTON, ONTARIO.

[*Official number*, 80.]

Latitude	44° 12′
Longitude	75° 41′
Elevation of barometer above mean sea-level	335.0 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

MONTREAL, QUEBEC.

[*Official number*, 56.]

Latitude	45° 31′ 0″
Longitude	73° 33′ 14″
Elevation of barometer above mean sea-level	182 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

PARRY SOUND, ONTARIO

[*Official number*, 108.]

Latitude	45° 22′ 0″
Longitude	80° 12′ 45″
Elevation of barometer above mean sea-level	635.0 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

QUEBEC, QUEBEC.

[*Official number*, 57.]

Latitude	46° 48′
Longitude	71° 12′
Elevation of barometer above mean sea-level	293 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

ROCKLIFFE, ONTARIO.

[*Official number*, 7.]

Latitude	46° 10′
Longitude	77° 45′
Elevation of barometer above mean sea-level	418.0 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

SAUGEEN, ONTARIO.

[*Official number*, 8.]

Latitude	44° 40′
Longitude	81° 10′
Elevation of barometer above mean sea-level	656.3 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

SYDNEY, CAPE BRETON.

[*Official number*, 6.]

Latitude	46° 12′
Longitude	60° 12′
Elevation of barometer above mean sea-level	27 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

TORONTO, ONTARIO.

[*Official number*, 58.]

Latitude	49° 39′ 4″
Longitude	79° 23′ 15″
Elevation of barometer above mean sea-level	350 feet.

Three observations have been taken daily, at hours simultaneous with the United States telegraphic series, and regularly forwarded to this office, tri-daily by telegraph and weekly by mail.

CHARLOTTETOWN, P. E. ISLAND.

[*Official number*, 127.]

Latitude	46° 14′
Longitude	63° 10′
Elevation of barometer above mean sea-level	38 feet.

Three observations are taken daily, at hours simultaneous with the telegraphic series of the United States, and sent to this office by mail weekly.

PORT DOVER, ONTARIO.

[*Official number*, 79.]

Latitude	42° 47′
Longitude	80° 13′
Elevation of barometer above mean sea-level	635. 0 feet.

Three observations are taken daily, at hours simultaneous with the telegraphic series of the United States, and sent to this office by mail weekly.

PORT STANLEY, ONTARIO.

[*Official number*, 78.]

Latitude	42° 40′ 0″
Longitude	81° 13′ 30″
Elevation of barometer above mean sea-level	592 feet.

Three observations have been taken daily, at hours simultaneous with the telegraphic series of the United States, and sent to this office by mail weekly.

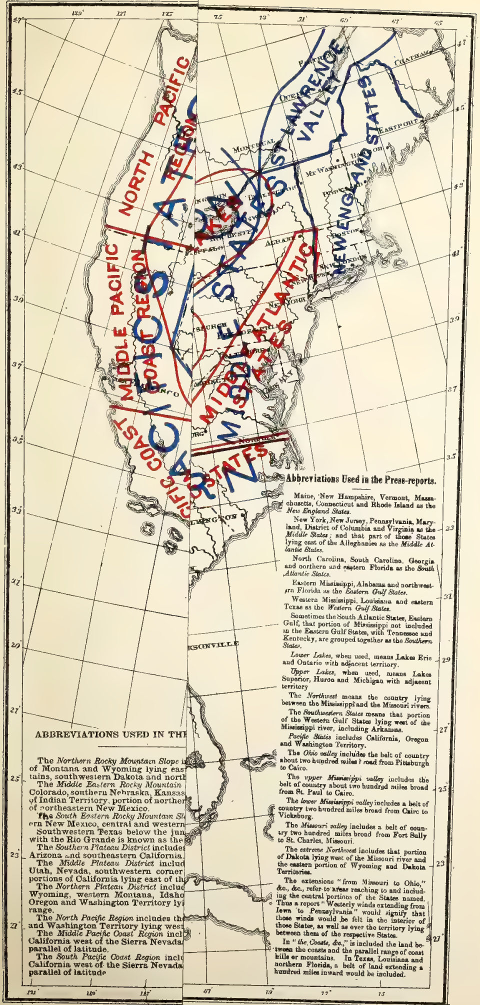
SIGNAL SERVICE STATIONS,
JUNE 30TH, 1880.



Abbreviations Used in the Press-reports.

Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island as the *New England States.*

New York, New Jersey, Pennsylvania, Maryland, District of Columbia and Virginia as the *Middle States*; and that part of those States lying east of the Alleghanies as the *Middle Atlantic States.*

North Carolina, South Carolina, Georgia and northern and eastern Florida as the *South Atlantic States.*

Eastern Mississippi, Alabama and northwestern Florida as the *Eastern Gulf States.*

Western Mississippi, Louisiana and eastern Texas as the *Western Gulf States.*

Sometimes the South Atlantic States, Eastern Gulf, that portion of Mississippi not included in the Eastern Gulf States, with Tennessee and Kentucky, are grouped together as the *Southern States.*

Lower Lakes, when used, means Lakes Erie and Ontario with adjacent territory.

Upper Lakes, when used, means Lakes Superior, Huron and Michigan with adjacent territory

The *Northwest* means the country lying between the Mississippi and the Missouri rivers.

The *Southwestern States* means that portion of the Western Gulf States lying west of the Mississippi river, including Arkansas.

Pacific States includes California, Oregon and Washington Territory.

The *Ohio valley* includes the belt of country about two hundred miles broad from Pittsburgh to Cairo.

The *upper Mississippi valley* includes the belt of country about two hundred miles broad from St. Paul to Cairo.

The *lower Mississippi valley* includes a belt of country two hundred miles broad from Cairo to Vicksburg.

The *Missouri valley* includes a belt of country two hundred miles broad from Fort Sully to St. Charles, Missouri.

The *extreme Northwest* includes that portion of Dakota lying west of the Missouri river and the eastern portion of Wyoming and Dakota Territories.

The extensions "from Missouri to Ohio," &c., &c., refer to areas reaching to and including the central portions of the States named. Thus a report "Westerly winds extending from Iowa to Pennsylvania" would signify that those winds would be felt in the interior of those States, as well as over the territory lying between them of the respective States.

In "*the Coasts, &c.,*" is included the land between the coasts and the parallel range of coast hills or mountains. In Texas, Louisiana and northern Florida, a belt of land extending a hundred miles inward would be included.

ABBREVIATIONS USED IN THE PRESS REPORTS

The *Northern Rocky Mountain Slope* includes those portions of Montana and Wyoming lying east of the Rocky Mountains, southwestern Dakota and northwestern Nebraska.

The *Middle Eastern Rocky Mountain Slope* includes eastern Colorado, southern Nebraska, Kansas, northwestern portion of Indian Territory, portion of northern Texas, also a portion of northeastern New Mexico.

The *South Eastern Rocky Mountain Slope* includes southeastern New Mexico, central and western Texas.

Southwestern Texas below the junction of the Rio Pecos with the Rio Grande is known as the *Rio Grande Valley*.

The *Southern Plateau District* includes western New Mexico, Arizona and southeastern California.

The *Middle Plateau District* includes western Colorado, Utah, Nevada, southwestern corner of Wyoming and the portions of California lying east of the Sierra Nevadas.

The *Northern Plateau District* includes portion of western Wyoming, western Montana, Idaho and the portions of Oregon and Washington Territory lying east of the Cascade range.

The *North Pacific Region* includes those portions of Oregon and Washington Territory lying west of the Cascade range.

The *Middle Pacific Coast Region* includes those portions of California west of the Sierra Nevadas and north of the 37th parallel of latitude.

The *South Pacific Coast Region* includes those portions of California west of the Sierra Nevadas and south of the 37th parallel of latitude

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

Albert J. Myer

BRIGADIER GENERAL, CHIEF SIGNAL OFFICER, U. S. A.

Abbreviations Used in the Press-reports.

Maine, New Hampshire, Vermont, Massachusetts, Connecticut and Rhode Island as the *New England States*.

New York, New Jersey, Pennsylvania, Maryland, District of Columbia and Virginia as the *Middle States*; and that part of those States lying east of the Alleghanies as the *Middle Atlantic States*.

North Carolina, South Carolina, Georgia and northern and eastern Florida as the *South Atlantic States*.

Eastern Mississippi, Alabama and northwestern Florida as the *Eastern Gulf States*.

Western Mississippi, Louisiana and eastern Texas as the *Western Gulf States*.

Sometimes the South Atlantic States, Eastern Gulf, that portion of Mississippi not included in the Eastern Gulf States, with Tennessee and Kentucky, are grouped together as the *Southern States*.

Lower Lakes, when used, means Lakes Erie and Ontario with adjacent territory.

Upper Lakes, when used, means Lakes Superior, Huron and Michigan with adjacent territory.

The *Northwest* means the country lying between the Mississippi and the Missouri rivers.

The *Southwestern States* means that portion of the Western Gulf States lying west of the Mississippi river, including Arkansas.

Pacific States includes California, Oregon and Washington Territory.

The *Ohio valley* includes the belt of country about two hundred miles broad from Pittsburgh to Cairo.

The *upper Mississippi valley* includes the belt of country about two hundred miles broad from St. Paul to Cairo.

The *lower Mississippi valley* includes a belt of country two hundred miles broad from Cairo to Vicksburg.

The *Missouri valley* includes a belt of country two hundred miles broad from Fort Sully to St. Charles, Missouri.

The *extreme Northwest* includes that portion of Dakota lying west of the Missouri river and the eastern portion of Wyoming and Dakota Territories.

The extensions "from Missouri to Ohio," &c., &c., refer to areas reaching to and including the central portions of the States named. Thus a report "Westerly winds extending from Iowa to Pennsylvania" would signify that those winds would be felt in the interior of those States, as well as over the territory lying between them of the respective States.

In "*the Coasts, &c.,*" is included the land between the coasts and the parallel range of coast hills or mountains. In Texas, Louisiana and northern Florida, a belt of land extending a hundred miles inward would be included.

It is found necessary to repeat in the annual reports of each succeeding year large portions of the annual reports of preceding years. The number of copies of the printed annual reports allowed to this office for distribution is small. The mode in which its duties are rendered is not yet fully understood by the public at large, and repetition is necessary that the readers may comprehend to some extent the office modes of operation.

A portion of the meteorological statistics for the year ending June 30, 1880, as had from the regular reporting stations and collated, are given in detail in papers 9 to 19.

One hundred and eighty-five stations, including those upon the telegraph lines in the interior in charge of the Signal Corps, were inspected during the year ending June 30, 1880. Paper 20 shows the name of each station inspected, with date of inspection, and name of inspecting officer. A number of officers are kept continually on duty as inspectors, and arriving at the stations without previous notice given, critically examine and report upon all facts in relation to them.

The instructions under which inspectors act and the character of the reports made by them are exhibited in paper 21 herewith.

The average cost of maintaining each full station of observation during the year ending June 30, 1880, exclusive of the cost of telegraphing reports and the pay and maintenance of the enlisted men on duty at each, has been $382.28, a decrease since the preceding year of $17.62 per station. In the cost of each station, as here given, is included the rent of and cost of maintaining a suitable office or room at each place for the public use, with facilities for the necessary exposure of instruments, and for the display of cautionary signals, when such signals are required.

The duties of the enlisted men at each station were fully described in the last annual report, as follows:

At stations forwarding telegraphic reports they are required to take, put in cipher, and furnish, to be telegraphed tri-daily on each day, at different fixed times, the results of observations made at those times, and embracing, in each case, the readings of the barometer, the thermometer, the wind velocity and direction, the rain-gauge, the relative humidity, the character and movement of upper and lower clouds, and the condition of the weather. These observations are taken at such hours, at the different stations, as to provide the three simultaneous observations taken daily at three fixed moments of physical time throughout the whole extent of the territory of the United States.

On November 18, 1879, the times of taking the morning telegraphic observations were changed to a time thirty-five minutes earlier, viz, from 7 hrs. 35 min. a. m. to 7 hrs. a. m., Washington mean time. On the same date the times of taking the afternoon telegraphic observations were changed so as to be taken one hour and thirty-five minutes earlier, viz, from 4 hrs. 35 min. p. m. to 3 hrs. p. m., Washington mean time.

These changes were made in order that the intervals between the observations should be uniform, viz, eight hours, it having been impracticable to change the time of taking the 11 hr. p. m., Washington mean time, observations.

Observations have, however, been and will continue to be taken at 7 h. 35 m. a. m., Washington mean time, at all the Signal Service stations until the change of time is made by foreign observers, which will occur on January 1, 1881. It being desirable that the observations taken abroad should be simultaneous with those taken in the United States, so that a daily chart of the Northern Hemisphere might be prepared, foreign observers were communicated with looking to that end. Mexico, through Señor Mariano Barcena, Director of the Central Meteorological Observatory, in the City of Mexico, replied favorably, and began taking observations a 7 h. a. m., Washington mean time, on July 1, 1880. He was requested to continue observations at a few stations at 7 h. 35. a. m., Washington time, until all foreign observers had changed to 7 h. a. m., Washington time.

It was suggested to the other countries that the change in time should go into effect on September 1, 1880, but, at the request of Russia, the date was postponed to January 1, 1881.

The following countries and separate observers have replied that they will make the change desired by the Chief Signal Officer, viz: Algeria, General Maritz; Canada, Mr. Charles Carpmael; Denmark, Capt. N. Hoffmeyer; Greece, Dr. J. F. Julius Schmidt; Mexico, Prof. Mariano Barcena; Portugal, Mr. J. C. de Brito Capello; Turkey, Prof. A. Coumbary; Barcelona, Spain, Mr. Antonio Rave; Beirut, Syria, Prof. C. V. A. van Dyck; Bogota, United States of Colombia, Mr. Thomas Herran; Burgos, Spain, Mr. Domingo Martin; San José, Costa Rica, Mr. F. Maison; Cape of Good Hope, Prof. D. Gill; Fort-de-France, Martinique, L'Abbé Marchési; Murcia, Spain, Mr. Olayo Diaz; Naples, Italy, Prof. Faustino Brioschi; Rivas, Nicaragua, Mr. E. Flint; St. John's, Porto Rico, W. I., Mr. Enrique Gadea; San Fernando, Spain, Capt. C. Pujazon; Santiago, Spain, Mr. R. G. Villanueva; Zurich, Switzerland, Prof. R. Wolf.

The following steamship companies have signified their intention of making the desired change, viz: Allan Line, Messrs. A. Schumacher & Co.; American Steamship Company, Messrs. Peter Wright & Sons; North German Lloyd, of Bremen, Messrs. A. Schumacher & Co.; Red Star Line, Messrs. Peter Wright & Sons. The following steamship companies made the desired change in January, 1880: California and Mexican Steamship Company, Mr. J. Birmingham; Occidental and Oriental Steamship Company, Mr. D. D. Stubbs; Oregon Railway and Navigation Company, Mr. K. van Oterendorp; Pacific Coast Steamship Company, Messrs. Goodall, Perkins & Co.; Pacific Mail Steamship Company, Messrs. Williams, Dimond & Co.

The following countries have expressed a willingness to comply with the request, provided other countries will do the same, viz: France, Prof. F. Mascart; Great Britain, Mr. Robert H. Scott; and Russia, Prof. H. Wild, who replies that he will endeavor to comply with the request of the Chief Signal Officer, and has already made preparation to issue notices to the different observers to take the simultaneous observations at 7 h. a. m., Washington mean time, from January 1, 1881.

The following have not been heard from: Austria, Prof. Dr. Julius Hann; Belgium, Mr. J. C. Houzeau; Germany, Prof. George Neumayer; India, Mr. H. F. Blanford; Italy, Prof. Pietro Tacchini; Japan, Mr. I. Arai; Netherlands, Prof. Buys Ballot; Norway, Prof. H. Mohn; Madrid, Spain, Mr. Antonio Aguilar; Stockholm, Sweden, Prof. R. Rubenson; Upsala, Sweden, Prof. H. H. Hildebrandsson; Nautical Meteorological Bureau, Stockholm, Sweden, Mr. F. Malmberg; Scotland, Mr. Alexander Buchan; Geneva, Switzerland, Prof. E. Plantamour; Montsouris Observatory, Paris, France, Prof. M. H. Marié-Davy; Zi-Ka-Wei, China, Rev. Marc Dechevrens, S. J.; Havana, Cuba, Rev. Benito Vines, S. J.; Manila, Philippine Islands, Mr. F. Faura, S. J.; Navassa, W. I., Mr. F. M. Everett; Paramaribo, Dutch Guiana, S. A., Mr. C. J. Hering; York Factory, B. A., Messrs. J. Fortescue and W. Wood; White Star

Line, Mr. R. J. Cortis; steamship Algeria (Cunard Line), Capt. W. Watson; steamship Samaria (Cunard Line), Capt. H. C. Miles; steamship Scythia (Cunard Line), Capt. W. H. O. Hains; ship Iron Cross, Capt. W. Randall; bark Nordenskiöld, Capt. Philip Landelin; brigantine George, Capt. W. H. Champlin; schooner Addie Fuller, Capt. J. Jörgensen; schooner Annie R. Lewis, Capt. L. L. Lewis; schooner Abby K. Bentley, Mr. A. R. Mehaffey; schooner Delia Hodgkins, Mr. S. S. Miner; barkentine Carrie Heckle, Capt. B. F. Woodbury.

In addition to the three telegraphic reports, three other observations to be taken at the local times, 7 a. m., 2 p. m., and 9 p. m., at the different stations are made and recorded at each station. A seventh and especial observation is taken and recorded at 11 hrs. a. m., Washington mean time, each day. If at this observation such instrumental changes are noted as to cause anxiety, the fact is to be telegraphed to the central office at Washington.

An eighth observation is required to be taken at the exact hour of sunset at each station. This observation, embracing the appearance of the western sky, the direction of the wind, the amount of cloudiness, the readings of the barometer, thermometer, and hygrometer, and amount of rainfall since last preceding report, is reported with the midnight report.

At the stations at which cautionary signals are displayed an observer must be constantly on duty to receive the order and to show the signal, which may be ordered at any moment. At stations from which river reports are furnished, an observation and record of the depth and temperature of the water is made and reported at a fixed hour on each day. In cases of threatening storms or dangerous freshets, any station may be called upon to make hourly reports. In cases of violent storms, reports are sometimes required to be made hourly during its continuance.

The data thus gathered on the files at each station are to be consolidated; first, weekly, on forms which, with copies of the telegraphic cipher reports, are to be sent weekly to the central office; then monthly, in the form of a careful digest, also to be forwarded. The thorough duty of the work of the month is then to be condensed in the form of a monthly chart. None of these observations or records ought to be dispensed with; nor can they, with meteorological instruments as they now exist, be taken and recorded more economically. At stations where the population warrants it the duties of the enlisted men are increased by the receipt and record of data from other stations, to be exhibited upon written bulletins or furnished to the press for public use. In the great cities there are the further duties of the display, at the rooms of the boards of trade, chambers of commerce, and other similar places, of symbol maps on which the meteoric conditions are shown by symbols, changeable daily.

There are to be prepared and posted also by the enlisted men, at these stations, bulletins of the storm-warning orders as received from the central office, on which appear very frequently, in addition to the order, brief notes as to the force of the anticipated storm, the direction in which it may be moving, the names of places menaced, though storm-signals may not yet have been ordered at them, and other items of information, all of which require to be carefully copied and posted with quick dispatch.

In cases of disasters occurring on the lakes or sea-coasts, full information concerning which is often in possession of the service, or in the instance of any matter of public interest coming within the scope of the duties of the service, the station force is required to exhibit bulletins containing in detail full reports.

The local offices of the Signal Service are always places of resort for inquiry on the part of those desiring to be informed what changes of weather have been particularly noticed, or are likely to affect the various industries in which the populations are engaged.

In the cities upon the sea-coast of the United States, or at the lake ports, the offices of the service are open for the comparison of instruments to obtain special instrumental readings, to make examinations of data, or to furnish whatever information may be practicable to captains of vessels or others concerned in shipping interests. At stations upon telegraphic lines in charge of or constructed by the service in pursuance and furtherance of its duties, the ordinary duties of telegraphing and the maintenance of the lines devolve upon the force there stationed, in addition to the duties of observation.

The cautionary signal flag is always, when flown officially, an invitation to mariners or others interested to visit the offices for information. The courtesies and duties of the office are not limited to the people of the United States alone, but are tendered freely to the people of any nation who may be within our borders.

The distribution of Farmers' Bulletins for the use of agricultural populations has been frequently and is elsewhere described.

The forms exhibiting, condensed, the labor thus required of the Signal Service men stationed at separate stations, and the instructions under which the separate observations and reports are made, are herewith described. (Paper 22.)

In times of especial emergencies or danger of any kind threatening the separate States or the United States, the different stations make, by order and in cipher by telegraph, regular reports upon any subject under the attention of superior authorities.

The enlisted men in charge of stations are responsible for the care, cleanliness, and good working of the instruments; the clearness of the records; the correctness and punctuality of the reports; display of signals or bulletins, and, in fine, for the conduct and good condition of the station itself. It has been considered necessary to make this description thus minute that it might be understood what duties are required of the non-commissioned officers and privates of the Signal Corps in addition to the military duties heretofore referred to, and that it may be comprehended that the force must consist of men of more than ordinary acquirements to be competent for such duties.

The sum of the pay and allowances of these soldiers comprehends every compensation which is permitted the soldier, to house, feed, and clothe himself, to meet in full every expense of his maintenance wherever in the wide extent of the territories of the United States the vicissitudes of the service may call him. It must be borne in mind that as a soldier he can have no home, and that he must purchase anew, with every change of station, the little comforts which homes gather around them. The regular tour of duty permits service on each station for two years only. These soldiers are liable to all a soldier's duties. On the occurrence of serious disturbances, the armed detachments of the corps are, with its officers, in readiness, wherever they may be, for service at a moment's warning. In the service upon the frontier they are exposed in their duties of the construction, repair, and maintenance of telegraph lines, or whenever they may accompany expeditions, to the dangers of the field.

In times of dangerous pestilence these soldiers are by their duties more exposed than other forces of the Army. Other forces may be moved, for sanitary reasons, to places of comparative safety. The exigencies of the service and the need that regular series of data should be had, by observations, on which to base precautions against existing epidemics for the time, and for the study of them thereafter, have required that the enlisted men of the service should remain faithfully at their posts during some of the worst visitations of disease which have devastated the country. As a rule they have done so without a murmur.

It has been considered that as the United States have, as above rehearsed in the case of the body of men constituting the Signal Corps, the military services of a force trained and competent to act as armed soldiers when there is need, there is in effect secured by the duties other than armed duties on which these men are employed, the benefits of all the special services rendered by the corps at stations of meteorological observations and report, at cautionary-signal stations, at stations on telegraphic lines, at sea-coast stations and elsewhere, with little compensation to the men, or cost beyond that of any other merely military force, equal in number, to the public.

The work of a constant watchfulness for the whole territory of the United States, and a plan of observation and report extending by its different branches around the northern hemisphere, is had through the service in the Signal Corps of one hundred and fifty sergeants, thirty corporals, and three hundred and twenty privates.

It is needless with such facts in view, and after nineteen years of continuous service, to reiterate the advantages secured to the Signal Service by its military organization. Service under military organizations is that form of a permanent civil service of disciplined citizens in which the duties are compulsory for the term of the service, and a proper discharge of them can be enforced by punishment. The experience of centuries has proven that whenever tasks covering in their reach the extent of nations, and involving in their execution interests of life and property, are to be undertaken, men have sought, as if by instinct, for faithful co-operation and prompt action through the regular control and sure reward or punishment which attend the military system. The soldiers of the United States are simply its citizens, held under what ought to be wise rules and regulations to duties which they have voluntarily accepted.

The duties of an army in time of peace have been defined as properly limited in their exercise to those of a police for the nation. It is considered that those rendered by the Signal Service have demonstrated that the men carried upon its rolls have been able to perform these duties and others requiring a higher standard of attainment, and rendering a better equivalent for the necessary cost. They have not failed to be ready to act armed upon any intimation that there was need of such readiness.

The duties of the force stationed at the office of the Chief Signal Officer, at the War Department, are many and onerous. In rendering these duties it ought to be borne in mind that they are continued day and night without cessation for holidays or days of rest. There is no single day of the year in which the work is suspended. It must of necessity and for this reason be performed by details of men who relieve each other at fixed times. The total force employed at this office numbers one hundred and ten enlisted men.

In estimating the numbers required to be present for duty, it is difficult to make a comparison between an establishment thus conducted and others in which the work is limited to certain hours of daylight only. This office is the center to which the daily and nightly, weekly and monthly contributions of all other offices or stations of the Signal Service scattered throughout the United States tend to be daily condensed, and finally elaborated and made of practical value. There are here concentrated, also, the reports from the six hundred and twenty-one places at which voluntary reports of daily observations are now made on this continent, and from the three hundred and twelve locations in foreign countries from which reports of daily simultaneous observations are had. From the great mass of data thus collected, and which enhances each year in value, are continuously elaborated the results which appear in the different issues of the office, whether in the form of forecasts telegraphed to the press throughout the country, of charts or bulletins distributed hence, of generalizations announced as apparent, of cautionary-signal orders, or the weekly and monthly publications. No single report of any observation received at the office fails to receive attention or study.

It is at this office that are had the management and supervision of telegraphic lines, erected and now worked by the United States, upon the Indian frontier and in the States and Territories of the interior. The wires of the coast lines have here their terminal connection, and here concentrates the labor of the different coast stations. Upon this office devolves, and with each year to an increasing extent, the duty of transmission of many and important messages from superior authorities to and from distant posts and parts of the United States, for the safe delivery and proper guarding of which, by cipher, if need be, this office is responsible. The rooms of the telegraphic department are never closed or left without an operator. The brief narration possible in a report of this character can convey but little idea of the various and incessant labors incident to such an establishment.

The regular exchange of telegraphic reports now had for a number of years by comity of exchange with the chief meteorological office of the Dominion of Canada has been maintained. Meteorological reports of observations taken simultaneously, and furnished according to the form of this office, have been received tri-daily from thirteen stations within the Dominion, and warnings have been regularly transmitted to the meteorological office of the Dominion at Toronto, as affording material on which to base the display of signals to be exhibited at ports of the Dominion at times of threatening danger. The telegraphic reports of observations received from twenty-six Signal Service stations of the United States have been furnished tri-daily to the agent of the Dominion office at Buffalo, N. Y. The relations thus maintained between the two services continue to be of service to both.

While this office has been prepared to co-operate in this manner with any foreign office, and to the limit of its power, in the furnishing of material for study, by the use of its consolidated reports or by especial warnings, it is not authorized by law to co-operate with any institution or party for the publication or display of any forecasts, indications, or cautionary signals not emanating from this bureau, or so controlled by it as not to conflict nor confuse those issued by this service for the Territories of the United States, the lakes, rivers, or coasts in or bordering upon them.

In view of the increased appropriation made available by the action of Congress at the last session, the series of telegraphic reports from stations in the West Indies, extending from Cuba, by Jamaica, to Barbadoes and the Windward Islands, have been partially resumed, two reports of observation being had on each day from each station during what is known as the hurricane season. Constantly recurring difficulties attend the collection of reports from these stations. The defective working of the telegraphic cables has frequently impaired the value of reports had from them by delay. It is difficult to secure the services of skilled observers or to obtain instrumental readings which at all accord with those at the regular stations. The crude reports are, however, at times useful.

Last year, in November, for the first time special frost indications were ordered to be forecasted and telegraphed from this office to New Orleans for the benefit of the sugar interests of Louisiana. Hereafter special attention will be given to the early forecasting of anticipated frosts for the sugar regions from the 1st of October to the 1st of February of each year. The warnings will be given as early as they can be with reasonable safety; if possible, three days in advance. This information will be furnished to interested parties and to the press of New Orleans, and sent by telegraph from that city to any point desired.

This office contemplates the early taking of steps to largely increase the usefulness of this service to the great cotton interests of the South, and to that end correspondence will soon be had with the representatives of the cotton exchanges to take into consideration the advisability of establishing a large number of auxiliary stations in the cotton belt to take rainfall and temperature observations, and also to select the most advantageous sites for such stations, which must be in telegraphic communication with the cities of the South, so that all cotton exchanges may receive daily information by telegraph of the meteorological conditions affecting the cotton crop from April 1 to October 1 of each year.

The network of the Signal Service stations extends now on this continent to both the Atlantic and Pacific coasts, and over the intervening territory of the United States. The work of the stations has been rendered utilizable for the daily provision of meteoric changes to occur over this whole geographical extent, including the great interior plateau. While the stations are in some districts far too widely separated the gaps are closing each year with steady progress. The service now has its stations located in continuous lines along the northern frontier of the United States from Maine to west of Lake Superior; along the Atlantic coast; along the southern or Gulf coast; along the southwestern boundary, separating the United States from Mexico, to the Pacific Ocean; thence northerly along the Pacific coast to British North America, and at selected points throughout the whole interior within these boundary lines. A continuous telegraphic line to follow, with near proximity, the line by which the United States, bound on British North America, from the Pacific Ocean to Lake Superior, mentioned in former reports as something to be hoped for and needed to properly complete the northern line of the circuit of stations, may be considered as now completed by the lines this summer erected in the Northwest under appropriations by Congress. This line forms the second transcontinental line carried by the labor of the Signal Corps across the continent. As other and new telegraphic lines extend within the boundary lines above referred to, they will make possible the establishment of other and much needed interior stations. The experience of years has reduced the matter of opening, equipping, and rapidly utilizing a station to a system.

The meteorological work of the United States keeps pace everywhere with the telegraphic construction. In the hands, and under the management, of a single corps, the two duties are necessarily coextensive.

The following list exhibits the stations, as classified and located in States and Territories, on June 30, 1880:

Alabama.—Mobile*, Montgomery*, Decatur**. *Alaska.*—Atka*, Attu*, Fort Saint Michaels*, Saint Paul Island*, Unalashka*. *Arizona.*—Burkes*, Camp Thomas*, Florence*, Fort Apache*, Fort Grant*, Fort Verde*, Phœnix*, Prescott*, Tucson*, Wickenburg*, Yuma*, Corrilla§, Maricopa§, San Carlos Agency§, Apache Pass||. *Arkansas.*—Little Rock*, Fort Smith**, Helena**. *British Columbia.*—Lytton†, New Westminster†, Victoria†. *California.*—Campo*, Los Angeles*, Red Bluff*, Sacramento*, San Diego*, San Francisco*, Visalia*, Colusa**, Folsom City**, Marysville**, Oroville**, Monterey†, Santa Barbara†, Yreka†. *Colorado.*—Colorado Springs††, Denver*, Pike's Peak*, Kit Carson†, Trinidad†. *Connecticut.*—New Haven*, New London*, Stonington‡, New Haven Light‡. *Dakota.*—Bismarck*, Deadwood*, Fort Buford*, Fort Yates*, Fort Stevenson*, Pembina*, Yankton*, Fort Meade||, Fort Bennett§, Fort Lincoln§, Grinnels'§, Knife River§, Plumb Creek§, Rapid City§, Smithville§. *Delaware.*—Delaware Breakwater*. *District of Columbia.*—Washington*. *Florida.*—Cedar Keys*, Jacksonville*, Key West*, Pensacola*, Punta Rassa*. *Georgia.*—Atlanta*, Augusta*, Savannah*. *Idaho.*—Boisé City*, Lewiston*, Fort Lapwai||. *Illinois.*—Cairo*, Chicago*, Springfield*, Warsaw**. *Indiana.*—Indianapolis*, Logansport¶, Evansville**. *Indian Territory.*—Fort Sill*, Fort Gibson*, Anadarko§, Cantonment§, Fort Reno§, Supply§. *Iowa.*—Davenport*, Des Moines*, Dubuque*, Keokuk*, Le Claire**, Muscatine**, Burlington¶. *Kansas.*—Dodge City*, Leavenworth*, Emporia†, Waterville†. *Kentucky.*—Louisville*, Paducah**. *Louisiana.*—New Orleans*, Shreveport*, Port Eads‡. *Maine.*—Eastport*, Portland*, Booth Bay‡, Deer Isle‡, Rockland‡. *Maryland.*—Baltimore*, Ocean City§. *Massachusetts.*—Boston*, Springfield*, Thatcher's Island*, Wood's Holl*, Chatham‡, Gloucester‡, Highland Light‡, Hyannis‡, Marblehead‡, New Bedford‡, Newburyport‡. *Michigan.*—Alpena*, Detroit*, Escanaba*, Grand Haven*, Marquette*, Port Huron*, Bay City‡, East Tawas‡, Forester‡, Frankfort‡, Houghton‡, Ludington‡, Mackinac City‡, Menomonee‡, Monroe‡, Muskegon‡, Northport‡, Pentwater‡, Port Austin‡, Roger's City‡, St. Joseph‡, South Haven‡, Traverse City‡, Sault de St. Marie†. *Minnesota.*—Breckenridge*, Duluth*, Saint Paul*, Wadena†. *Mississippi.*—Vicksburg*. *Missouri.*—Saint Louis*, Boonville**, Bismarck**, Hermann**, Jefferson City**, Kansas City**, Lexington**, St. Joseph**. *Montana Territory.*—Fort Assinniboine*, Fort Benton*, Fort Custer*, Fort Keogh*, Fort Shaw*, Helena*, Virginia City*, Radersburg§, Rosebud§, Rock Creek§, Shield's River§, Stillwater‡, Terry's Landing§, Fort Ellis||, Bozeman§, Burn's Ranche§, Coal Banks§, Deer Lodge§, Ferry Point§, Fort Sully§, Green's Ranche§, Hunter's Springs§, La Beans§, Little Missouri§, New Chicago§, Powder River§. *Nebraska.*—North Platte*, Omaha*, Central City†, Sydney†, Plattsmouth**. *Nevada.*—Pioche*, Winnemucca*, Austin†, Hamilton†. *New Hampshire.*—Mount Washington*, Portsmouth‡. *New Jersey.*—Atlantic City*, Barnegat*, Cape May*, Sandy Hook*, Little Egg Harbor||, Belvidere†, Elizabeth†, Flemington†, Freehold†, New Brunswick†. *New York.*—Albany*, Buffalo*, New York City*, Oswego*, Rochester*, Cape Vincent‡, Charlotte‡, City Island‡, Dunkirk‡. *New Mexico.*—La Mesilla*, Santa Fé*,

Map 1 exhibits the location of stations and the extent of territory brought by them under constant observation for the purposes of study.

The territory of the United States is not yet covered with stations as it ought to be, and valuable opportunities for study, which must be made good hereafter, and at an increased expense, are lost. The field of labor has increased greatly each year, as it has been learned how labor may be turned to the best benefit of different classes of citizens. The amount estimated as necessary to be appropriated for this service for the ensuing year, the sum of four hundred thousand dollars, can be wisely expended. The whole working force of the corps, five hundred men, will be constantly employed, and, in instances, overworked. The services of civilians, in addition, will be needed as in preceding years.

The reports of observations had in ceaseless succession from the stations already established, while daily and primarily employed in the studies needed for the daily issuing of forecasts and the display of cautionary signals, form also the basis for future work, to be of equal value with that made possible by the first use of them, and constitute a record, to increase in worth hereafter with every year for which it is continued.

The data already secured are worth to the country and to the world, even if the service had up to this time rendered no other return, all it has cost to obtain it.

From the moment at which it is made, each of the reports becomes to some extent complementary to all other reports had elsewhere. It is not possible to break this connection, nor in the present state of meteorological science ought any good report to be dispensed with.

It will be found, with the lapse of years, such observations have settled, by facts, questions hitherto treated by the theory only.

It is upon the data now accumulating upon the files of this office and there daily compared, compiled, and treated with an accuracy each year increased by experience, and becoming more rigid as the office is warned, sometimes by notable inaccuracies elsewhere occurring, that the future studies of the climatology and meteorology of this continent will be based. It seems not impossible that upon the results of systems of observations here first established will be founded such studies for the northern hemisphere. It is not to the discredit of the United States that a work set on foot by them should render such ends possible.

One of the difficulties in determining probable meteoric conditions on the eastern seaboard has been that this office could not obtain weather observations from points beyond the extreme limit of the coast; and that commerce may be further benefited, propositions will be made to have the vessels engaged in the coasting trade of the United States, furnish this office with transcripts of their logs; to enable vessels to furnish these with the least trouble and expense blank forms will be issued for that purpose from the Signal Office.

The permanence, regularity, and accuracy of reports to be had from the West Indies ought to be secured. No system providing warnings for the Gulf or Atlantic coasts can be considered as complete or reliable without the means of continued reports of observation, to be made from these stations. It seems to be established that the great cyclones originating within the tropics rarely, if ever, reach any coast of the United States without such indications of their existence and of their line of movement as well-managed stations among these islands would detect and announce. The possibility of protection will be increased and extended to more northern coasts whenever telegraphic communication can be had with the Bermuda Islands.

The attention of the office has continued to be directed, as in preceding years, to the solution of the difficult question as to the best mode by which to compare, for the purposes of the necessary daily studies, the observations of atmospheric changes taking place upon the Pacific coast, near the sea-level, and upon the great elevated plateau of the interior, with the reports of observations had at the same time on the eastern slope of the Rocky Mountains, and extended to the Gulf and Atlantic coasts at the sea-level. Progress is made in this direction. It is found not difficult to extend several of the office charts from the Pacific to the Atlantic coasts at the time of each tri-daily report, with the lines of the charting in so far accurate as to afford valuable suggestions as to the changes approaching.

The spread of civilization over the great interior plateau west of the Mississippi each year renders more extended observations practicable in that region.

The field of study has been pushed in that direction as rapidly as the means at the disposal of the office have permitted. The barometrical readings made in this section still lose part of their value by the difficulty of reduction to the hypothetical readings at sea-level. There seems, however, reason to hope that the unreduced readings can be utilized for purposes to which the reduced only have been hitherto applied. It is, perhaps, by multiplying stations and continuing the comparison of observations had at them, the correct solutions of all problems will be most rapidly attained.

The studies made this year in the matter of the hypothetical reductions to sea-level give reason to hope that processes have suggested themselves by which the hypothetical barometric readings referred to may be arrived at with sufficient accuracy for any practical purposes of meteorological charting.

The increased knowledge had enables improvements to be made each year; in the modes of digesting the masses of observations received upon the records, and suggests each year better methods of study to attain the accuracy of prediction which is constantly sought.

It is in consideration to equip the station upon the summit of Pike's Peak, at an elevation of 14,150 feet, with instruments for the study of solar observations, and in particular of those to be made at sunset, to trace, if possible, what connection there may be between conditions then observed and meteorological changes which follow. Instruments for this purpose are now in preparation. In this work the office has had, and still has, the zealous co-operation of its distinguished co-laborer, J. Norman Lockyer, F. R. S. These series of observations will become more valuable with each year. It is to be hoped facts leading to important improvements in meteorological study will be established.

The long-felt need of carefully studying the changes occurring upon the interior plateau led to the establishment, prior to the date of the last annual report, of a series of observations had at what are known as "sunset" stations.

Reports have been received regularly during the year ending June 30, 1880, from "sunset" stations established at the following-named points: Austin, Nev.; Santa Barbara, Cal.; Kit Carson, Colo.; Central City, Nebr.; Eugene City, Oreg.; Fort Fetterman, Wyo.; Fillmore City, Utah; Saint. George, Utah; Hamilton, Nev.; Hat Creek, Wyo.; Lytton, British Columbia; Sault Ste. Marie, Mich.; Edson,* Wyo.; Monterey, Cal.; Sidney, Nebr.; Trinidad, Colo.; Victoria, Vancouver's Island; Wadena, Minn.; Waterville, Kans.; New Westminster, British Columbia; Yreka, Cal.; Emporia, Kans.; Pembroke, Canada. Each station is in charge of a civilian observer, under the immediate direction of this office, who is required to note, and report by telegraph each day, the character of the western sky and sunset; the state of the weather; direction of the wind; appearance of the sky; amount of rainfall, if any; observed readings of barometer and wet and dry bulb thermometers. Observations are also taken daily and reported weekly by mail from "sunset" stations at Belvidere, N. J.; Elizabeth, N. J.; Flemington, N. J.; Freehold, N. J.; and New Brunswick, N. J.

Some of the observations, as stated in the last annual report, are roughly spectroscopic, the sunset report being based, in part, on such different appearances of the sun and of the effects produced by its rays, as are caused by their passage through differently-conditioned atmospheric media. It is one of the advantages that the necessary observations are so little complicated in their character that they may be taken at and reported from any point reached by the telegraphic wires. It seems probable that a simple form of spectroscope may be utilized for observations of this sort. Experiments have been continued during the year, by which it is hoped that a form of that instrument suitable for the use of enlisted men may be arrived at. The reports are found of value in often-recurring instances in which they furnish some indication of the atmospheric changes in progress at points from which it has been impossible to obtain the full report of observation.

It has been established that a certain accuracy of forecasting the local weather changes to occur, at the respective stations, within a period of twenty-four hours has been acquired by the sergeants of the Signal Corps charged with the making of the sunset reports. These sergeants have the use of meteorological instruments and access to a portion of the data which pass their own stations on their way from other stations to this office. This accuracy has reached, as computed from the records on file, a maximum percentage of eighty-nine and two-tenths for the regions west of the Mississippi Valley, where the weather conditions are notably constant, and eighty-two and six-tenths for the region east of the western bounds of that valley.

---

*Formerly Saint Mary's. Name of town changed May 1, 1880.

There can be no reason that any intelligent farmer, supplied with the necessary simple instruments, habituated to similar observations, and furnished with data, either in figures or condensed by charts, should fail to attain an equal accuracy.

Since the date of the last annual report the instrument known as the Weather Case, or Farmer's Weather Indicator, has been thoroughly tested by prolonged trial. Reference is made, later in this report, to this instrument, which has been prepared with a view to its use by farmers generally.

The usefulness for meteorological purposes of the sea-coast stations of the Signal Service, in connection with the life-saving service, and located at the life-saving service stations, has continued to be demonstrated.

As explained in earlier reports, the observations taken at these stations have the advantage of being taken on the sea-coast itself, near the sea-level, and from positions which permit the conditions of the sea-swell to be reported. The stations have the further advantage of being directly connected with this office by the telegraphic lines under its control. Reports of any character can so be had at any hour they may be called for, or signals may be displayed to warn of danger.

The facilities afforded by these lines admit of conversations even being had, as they frequently are, in reference to meteorological changes or other matters, as, for instance, of the precautions to be taken against coming storms by those engaged in the salvage of wrecked ships, or other action in cases of shipwreck. The reports of observations had upon the sea-coast itself, or upon the ocean beach, differ frequently and markedly from those had from stations farther in the interior, and suggest the approach of weather conditions which, without such indications, might either have escaped attention, or could not have been observed in time.

The generalizations had from the reports received from these stations become each year of increasing value for the prediction of the weather conditions to be expected near our coasts. The reports themselves, published in the daily journals, and so known to those interested, either at the several ports or in the interior, give reliable information as to the circumstances under which coasting voyages may be taken or are being made. The benefits to follow a sea-coast service, with its stations properly prepared and equipped, are such as cause it to be hoped that all the exposed and frequented coasts of the United States may early have the advantage of such protection.

It is considered to have been demonstrated that by the services of single sea-coast stations there has been saved, at different times, property amounting in value to more than the cost of manning and maintaining all the stations from the dates at which they were first put in operation. Improving modes of communication promise as possible such close connection between the stations that it seems practicable to so arrange that there need be no points upon our coasts but to which aid can be immediately summoned, and none but from which summons for aid can go, if need be, to naval stations, posts, and cities.

The use at the sea-coast stations of telegraphic gongs connected by wire, after the manner of those used for fire-alarms, and intended to be operated from any point upon the coast at which telegraphic communication exists, or may be temporarily established for the purpose of calling the attention of any stations, has been continued. Gongs to be operated in this way are located in the offices at Norfolk, Cape May, Thatcher's Island, Kittyhawk, and the central office in this city.

The stations on the telegraphic lines, constructed in pursuance of acts of Congress on the Indian and Mexican frontiers and in the Northwest for the better protection of frontier populations, together with those for the purpose of connecting military posts and stations, serve better each year the ends for which, in part, the lines were first recommended—that of extending the fields of meteorological study over regions so sparsely settled as to be almost beyond the limits of civilization.

They have made possible the daily receipt of meteorological data from regions in which the collection of such data had been before considered impracticable. They have furnished for the office a daily knowledge of the atmospheric conditions existing along the whole course of the wires. The value of these reports, completing as they now do both the southern and the northern lines of the whole system of reports established for the territory of the United States, is very great. The lines make practicable also the receipt at the regular telegraphic stations of reports from regions in the interior of the country near them which, both at the North and at the South, have been but recently explored, and from which every reported observation is of value. The completion of lines similarly constructed and managed for similar purposes in proximity to, and following the general direction of, our northwestern frontier, from the station at Bismarck to the stations in Idaho and on the Pacific, foreshadows the best results for the interests of this especial service, and for the protection and development of that portion of our territory.

The events of the past year have illustrated what might be the uses of such lines in Indian wars. They make safer the settlement of the country. They make possible the establishment of stations valuable for meteorological reports.

Telegraphic reports from the eastern Mexican coast (the western coast of the Mexican Gulf) are still to be desired for the proper protection of the shipping in the gulf and of the gulf coasts of the United States. Cyclones moving over the West Indies, and thence pursuing a course over the Gulf of Mexico, would doubtless often manifest themselves on or near the coast of Mexico in time to permit warnings to be thence given to our own. The regularity of the telegraphic communication now had over the government lines upon the Mexican frontier and in the State of Texas has established the fact that reports collected in Mexico along or near the Mexican coasts, and transmitted over wires working with fair success, could be concentrated at this office with sufficient rapidity.

The organization by the Mexican Government, under Señor Mariano Barcena, of a system of meteorological reports from stations extended over a great portion of the Mexican territory, and carefully conducted, renders the results of that work more valuable for this purpose than in any preceding year. It is to be hoped that arrangements may be early made by which these reports can be received by telegraph. The notices for the display of cautionary signals issued from this office could reach Mexican ports as well as our own.

It is to be hoped that the sums appropriated for the service and the co-operation of the Mexican Government will permit reports to be had from these coasts within the coming year.

The international meteorological work, based upon plans suggested by this office, and carrying into practical effect a proposition adopted at a congress of persons charged with meteorological duties, assembled at Vienna in 1873, "that it is desirable, with a view to their exchange, that at least one uniform observation, of such character as to be suited for the preparation of synoptic charts, be taken and recorded daily and simultaneously at as many stations as practicable throughout the world," has continued to give satisfactory results. This work has now completed the fifth year of its progress.

With the approval of the Secretary of War, and with the courteous co-operation of scientists and chiefs of meteorological services representing the different countries, a record of observations taken daily, simultaneously with the observations taken throughout the United States and the adjacent islands, has been exchanged semi-monthly. These reports are to cover Algiers, Australasia, Austria, Bahamas, Barbadoes, Bavaria, Belgium, Cape Colony, China, Costa Rica, Denmark, Dutch Guiana, Faröe, France, Germany, Gibraltar, Great Britain, Grand Canary, Greece, Greenland, Hebrides, Hungary, Iceland, India, Ireland, Italy, Japan, Malta, Mexico, Morocco, Mauritius, Natal, the Netherlands, Norway, Portugal, Russia, Scotland, Shetland, Sierra Leone, Spain, Sweden, Switzerland, Syria, Tasmania, Tunis, Turkey, Dominion of Canada and the Provinces, United States of Colombia, South America, the United States, the Azores, Madeira, Philippine Islands, and West Indies.

The daily issue of the printed bulletin exhibiting the international simultaneous reports commenced at this office on July 1, 1875, has been maintained during the year. A copy of this bulletin is furnished, without charge, to each co-operating observer. The results to be had from the reports thus collated are considered to be of especial importance. The bulletin combines, for the first time of which there is record, the labors of the nations in a work of this kind for their mutual benefit. There is still needed the assistance to be had from the naval forces of the different powers (that of the United States, of Portugal, and of France) to extend the plan of report upon the seas to bring more fully within the scope of study observations practically extending around the northern hemisphere.

A copy of the International Bulletin herewith (Paper 24) exhibits the character of the international reports and that of the information had from each station. The chart accompanying this bulletin shows, as nearly as practicable, the location of the station and foreshadows the studies which the reports had from them will make practicable.

The average number of daily simultaneous observations now made in foreign countries is three hundred and one. The total number of stations on land and on vessels at sea from which reports are entered in the bulletin regularly is five hundred and thirteen. The co-operation of the different nations secured by this plan of exchange has rendered the additional cost to the United States of this grand system of reports it makes possible but little more than that of the cost of the preparation, paper and binding of the International Bulletin and the accompanying charts, a cost which would have to be met in great part for the proper presentation of the records themselves, even if this bulletin were not distributed.

The issue of the daily International Weather Map, commenced July 1, 1878, has been continued during the year. Each daily chart is based upon the data appearing upon the International Bulletin of similar date. The charting extends around the world and embraces for its area the whole northern hemisphere.

The daily issue of a chart of this kind, thus daily issued for the first time by the United States, was without a precedent in history. It exhibited the co-operation, for a single purpose, of the civilized powers of the world north of the equator.

The studies which such charts make possible, the improvements which will come to the charts as the work progresses and the area of the chart is better filled with reports of observations carefully elaborated, are appreciated by scientific men. The questions as to the translation of storms from continent to continent, and of the times and directions they may take in such movements; the movement of areas of high and low barometer; the conditions of temperature, pressure, and wind-direction existing around the earth at a fixed instant of time; the distribution and amount of rainfall, and other studies, many and valuable, only suggested by this enumeration, may be by such studies settled. It seems not impossible that in the future questions of climatology, and perhaps others bearing upon the prediction of weather changes far in advance of the time at which these changes may happen, or queries as to the character of coming seasons even, may be answered by the researches these charts will make practicable.

The very great aid the material furnished in this elaborate form gives to the search for generalizations, or for data in the support of theories, has been before referred to. In frequent cases, little more than collation is necessary.

As a means of better combining the work and the interests of the several nations, of certainly securing that co-operation at sea which will enable the lines of the charting to be drawn as fully and as well over oceans as over continents, and which will give the world ultimately a knowledge as practical of the movement of areas of disturbance in the midst of the seas as is now had of such movement on some continents, the undertaking is of much importance.

It is an advantage of the charting draughted from simultaneous reports that studies by normals, not possible in any other way, may be had. The normal pressure, temperature, &c., arrived at from observations taken at any one place, and the same and a fixed instant of time every day, become established as to that place and time with accuracy. Many causes of error are eliminated.

The intercomparison of these normals with the normals taken at other places simultaneously with the first and under the similar conditions that the normals to be found for those places are to be from observations taken at those places at a fixed time and on every day, gives results reliable and differing from those to be had by the use of normal readings arrived at in any other manner. Normals for the year, for the season, and for the month may be determined by such procedure. The comparison of such normals will show in the case of abnormal changes in any district or section whether and how these changes are compensated by compensating variations elsewhere. There are interesting studies as to what sequences there may be to follow such atmospheric variations occurring over any region or country—either in that region or country or elsewhere—and how and where the compensating variations occur, and with what concomitants or sequences of meteoric changes.

There is the hope to gain in this way, or by studies such study will suggest, information to affect the commercial and agricultural interests of the world.

By observations spoken of as simultaneous observations, there is meant, in the parlance of this office, observations actually taken simultaneously in reference to physical time. The readings for observations of this character, made at different stations, no matter how widely separated, are attempted to be so made that they will be in effect made together; that is, that the different observers at the different stations will each be at his separate instruments, reading them for the observation at the same moment that each and all of the other observers are at their separate instruments for the purpose of making the same observations.

In the case, for instance, of an observation or series of observations to be made at Tokio, San Francisco, New York, London, St. Petersburg, and Calcutta, the observers at each of the stations named—and the list might be prolonged indefinitely—are so instructed that at each station, and at the moment fixed for the observation, an observer would be found at the instruments taking the proper readings. So rigidly is this plan followed throughout the United States, that not only are the instruments required to be read at the different stations at that moment of physical time which has been fixed for all, but the instruments are required to be read in a certain and fixed order or sequence.

The observations are thus made, in fact, simultaneously, precisely as if—in a supposable case—the different sets of instruments, instead of being scattered over the surface of the earth, had been gathered in a single room, and the observers then directed to read the different sets together, and at once, at a fixed moment of time. Observations of this character have no resemblance to those made at similar hours named, by local or clock time, at different stations. Observations taken at similar hours of the local or clock time, at different stations, are, in effect, taken at very different hours of physical time, the differences increasing with the number of degrees of longitude intervening between the different stations. Thus, observations taken at Washington and San Francisco at the similar hours, 7 a. m., 2 p. m., and 9 p. m., of local time at the two cities, would in fact be taken at Washington three hours and two minutes before the same observations would be taken at San Francisco. Observations of this character might very properly be styled synchronous, for they are so as to local time; they are not in any way simultaneous. The distinction ought to be very carefully made. Much confusion has entered meteorological writings because this distinction has not been rigidly observed. In some of the earliest works having reference to practical meteorology, there is mention of chartings based upon observations taken "simultaneously" at different stations, at 3 p. m., or other hours fixed by local time. The use of the words "simultaneous" and "synchronous" as synonyms is not yet abandoned.

Before the introduction of the electric telegraph it was difficult to conceive of observations to be taken simultaneously, and to be concentrated with sufficient rapidity for use for any practical purpose. On the very limited fields it was then possible to consider, for study, observations taken at the same hour of local time presented themselves in appearance as taken simultaneously. It seems to have fallen to this office to first establish, for purposes of forecast, systems of observation based upon the fact that the observations were to be actually taken simultaneously, and to have first so arranged telegraphic circuits connecting the different stations that the observations taken simultaneously should move simultaneously by wire to a given center—the central office. It is by simultaneous observations only that a true synopsis of the atmosphere over any extent of the earth's surface can be given; the atmosphere being so photographed, as it were, before any changes in its condition can have been caused by motion. It is a peculiarity of such charting that it is unlimited as to its extent, and improves for any purposes of meteorological study the greater the extent given to it.

The comparison of charts covering the same surfaces and based upon simultaneous observations is easy, and when, for close study, the charts are made to follow each other in regular sequence, the observations being taken at times so fixed as to divide the daily twenty-four hours into equal periods of time, they offer advantages which it is not possible to arrive at by any other process. It is charts of this description which render a world-wide study possible, and with which will be attained in the future results, up to this time, only but faintly foreshadowed.

The work of this office is based almost wholly on observations of this description. The office series of simultaneous observations has run continuously from November, 1870. It is through observations of this character the concurrence of the nations has been invited for the preparation of the charts hoped to be extended until they cover the world.

Since the date of the last annual report additional international charts have been added to the series of charts. These charts are, like those before referred to, charts of the whole northern hemisphere, and are so made as to exhibit with close approximate correctness the geographical relations of the earth and water surfaces in that hemisphere to each other. They display, condensed by months, the means of barometric pressure, of wind direction and force, the means of temperature, and the average course of movement of areas of low barometer for each month. These charts are based almost wholly upon the international exchange of reports taken simultaneously.

The wide circulation given these charts in the Monthly Review, to which they form now an accompaniment, offers this world-work to many readers. It completes for the present the series of charts, to form which the labors of the international service were at first undertaken, and opens easily to study a field of research very nearly coextensive with the northern hemisphere. A series of charts for the special study of storm-tracks are prepared as an established office series. On such charts are traced ocean-storm tracks, these tracks being charted primarily over this continent by the regular reports at this office and at sea and on other continents, by such meteorological reports as may be had from the sea and the distant continents, together with such other information as may be collected at this office up to the dates at which the several charts issue. The construction is continuous from month to month, a storm-track commencing in one month appearing on and being continued on the charts issued for the next succeeding month, the portion of the track continued in this latter month being located by such supplementary information as may have been collected up to the date of the last issue. Thus for each succeeding month.

Examples of these charts are found accompanying the issues of the Monthly Review, in their sequence.

In this connection the office has to acknowledge, as in preceding years, the cordial and valuable co-operation of the meteorological services of the different countries represented as follows:

Algeria, Morocco and Tunis, by General Maritz, Commandant Supérieur du Génie en Algérie; Austro-Hungary, by Prof. Dr. Julius Hann, director of the Imperial and Royal Central Meteorological Institute at Vienna; Belgium, by J. C. Houzeau, director of the Royal Observatory at Brussels; Great Britain, by the Meteorological Council, through Robert H. Scott, esq., F. R. S., secretary, London, and by Alexander Buchan, M. A., F. R. S. E., secretary of the Scottish Meteorological Society, Edinburgh, and the respective observers; Costa Rica, by Señor Federico Maison, director of the Central Office of Statistics and Meteorology; Denmark, by Capt. N. Hoffmeyer, director of the Royal Danish

Meteorological Institute at Copenhagen; France, by Prof. E. Mascart, director of the Central Meteorological Bureau of France, and the respective observers; Germany, by Prof. Dr. G. Neumayer, director of the German Marine Observatory, Hamburg; Greece, by Prof. Dr. J. F. Julius Schmidt, director of the Royal Observatory at Athens; India, by H. F. Blandford, Meteorological Reporter to the Government of India; Italy, by His Excellency the Minister of Public Instruction, and the respective observers, through Prof. P. Tachini; Japan, by I. Arai, director of the Imperial Meteorological Observatory at Tokei; Mexico, by His Excellency the Secretary of Public Works, through Señor Mariano Barcena, director of the Central Meteorological Observatory in the city of Mexico, and the respective observers; Netherlands, by Prof. Buys Ballot, director of the Royal Meteorological Institute of the Netherlands at Utrecht; Norway, by Prof. H. Mohn, director of the Royal Norwegian Meteorological Institute at Christiania; Portugal and Portuguese Naval Series, by J. C. de Brito Capello, director of the Meteorological Observatory of the Infante Dom Luiz at Lisbon, and the respective observers; Russia, by Prof. H. Wild, director of the Imperial Central Physical Observatory of Russia at St. Petersburg; Spain, by Antonio Aguilar, director of the Royal Observatory at Madrid, and the respective observers; Sweden, by Prof. R. Rubenson, director of the Royal Swedish Meteorological Institute at Stockholm, by F. Malmberg, director of the Nautical Meteorological Bureau, and by Dr. H. H. Hildebrandsson, director of the Meteorological Division of the Upsala Observatory; Switzerland, by Prof. R. Wolf, director of the Observatory at Zurich, and by Prof. E. Plantamour, director of the Observatory at Geneva; Turkey, by A. Coumbary, Effendi, director of the Central Observatory at Constantinople, and by Prof. C. V. A. Van Dyck, superintendent of the Lee Observatory at Beirut; Canada, by Prof. G. T. Kingston and C. Carpmael, superintendent of the Meteorological Office of the Dominion of Canada, and director of the Magnetic Observatory at Toronto, and the respective observers; United States Navy, by His Excellency the Secretary of the Navy, through Commodore W. D. Whiting, U. S. N., Chief of the Bureau of Navigation; and by individual observers at other points.

A number of observations taken on vessels at sea to complement the simultaneous reports of this service, and at the request of this office, have been received on the form provided for this purpose. The vessels furnishing these reports belong to the navies and commercial marines of different nations. The utility of the reports is evident in the study of storms approaching our coasts or which endanger vessels sailing from our ports.

The co-operation of the Navy of the United States in the taking of observations simultaneously and in accordance with the system adopted at this office wherever naval vessels of the United States may be, as established by the general order of the Secretary of the Navy, dated December 25, 1876, has largely increased the data of this class. This co-operation has been skillfully rendered by the Navy Department and the United States Navy, through the commanders and officers of vessels and the Chief of the Bureau of Navigation.

The people of the United States are thus the first nation whose Army and Navy co-operate, as all armies and navies should, under official orders, in the taking of simultaneous observations wherever the forces may be. This co-operation has now existed for nearly four years.

In view of the accomplished establishment of the system of simultaneous reports to be recorded and made at sea by the vessels of the naval and commercial marines of the United States and of other nations, and to provide for the extension of the system, carefully tested barometers of the best make have been prepared and kept located, as standards, at the ports of New York and San Francisco. These instruments have now been in use for reference; that at New York since 1877, that at San Francisco since December 1, 1878.

These barometers are publicly located and displayed to afford means for comparison of the ships' barometers of the shipping of all nations. The instruments, while carefully guarded, are easily accessible. Public notice is given of the location of them, and a sergeant of the Signal Corps attends daily to give information and to take charge of any ship's barometer which may be brought for comparison. (Paper 25.)

The standard barometer for the use of shipping in the Atlantic Ocean is located at the Maritime Exchange, in New York City; the standard barometer for the use of shipping in the Pacific Ocean is located at the Merchants' Exchange, in the city of San Francisco. During the year just past the uses of these instruments have become more and more appreciated, and frequent applications are made by the commanding officers of foreign vessels, as well as by the shipping of the United States, for the comparison with the standard of the barometers carried by their vessels. The sergeant in charge of the duty of comparison at New York states that not unfrequently barometers are brought to him for rectification which have neither been compared nor adjusted since the time at which they had been placed upon the vessels by which they were carried, and that errors of half an inch in the reading are frequently found. The barometers are carefully put in good condition before they are returned to their owners. No charge is made under any circumstances for any part of the important work thus undertaken by the service.

The officers of the Signal Service located at the different cities and ports of the United States, and upon the sea-coast, offer every facility and aid in their power to the vessels of any nation.

With the plans for charting now adopted at this office, and with the reports now received here, it appears that the meteoric changes occurring over a great portion of the continents north of the equator can be charted with an accuracy sufficient to permit careful and valuable study. This charting, to be of the best attainable value, must be supplemented from the records of observations had on the seas. A ship at sea becomes one of the best of stations for a simultaneous system. The value of the record is enhanced by the change of the ship's location during each period of interval occurring between the separate simultaneous observations. Thus, a vessel making three simultaneous observations daily, on any given route, answers, for the meteorological study extending over that route, the purpose of three separate stations. There is no sea-going vessel but which carries human life, and each ought to carry, by compulsion, if need be, meteorological instruments. The smallest craft, in caring for its own safety, may use them enough to add to the value of the most extensive record. There is no nation without interest in the work proposed to be based upon exchanged simultaneous reports, and none has hitherto hesitated, when the subject has been properly presented, to aid in a duty which, so easily done as to require very little effort on the part of any person, has for its object a good to mankind. The work cannot, from its nature, be for the selfish good of any section.

A number of the great steamship companies, foreign and domestic, operating the principal commercial sea routes, give their powerful influence and aid.

The office has the co-operation of the Pacific Mail Steamship Company, through its agents, Williams, Dimond & Co.; the White Star Line, through its agents, Ismay, Imrie & Co., Liverpool, and R. J. Curtis, New York; the Occidental and Oriental Steamship Company, through its president, George H. Bradbury; the North German Lloyd, through its agents, A. Schumacher & Co.; the American Steamship Company, through its president, H. D. Welsh; the Red Star Line, through its president, James A. Wright; and the Allan Line, through its agents, A. Schumacher & Co.

The United States bear, in the cases of all maritime observers, co-operating in this system, all expenses for forms, postage, &c., when so desired, and frequently, when necessary, loan the required instruments.

The number of observations made daily on separate vessels at sea is one hundred and twenty-two. (Paper 26.)

Research has already gone far enough to indicate the paths by which, if it cannot be directly predicted, it can at least be studied, to learn what sequences to follow conditions reported on or near the eastern coast of Asia, or on the Pacific, will be found on our western coasts.

Similar studies will have reference to our own southern and eastern coasts, and to the western coasts of the European continent. The time cannot be far distant when vessels leaving any Atlantic port may be informed whether any notable disturbance exists at sea and when it is likely to threaten the voyage.

The establishment of permanent ocean stations in lines traversing the ocean over or near the telegraphic cables, and in telegraphic communication with either continent, is not considered impracticable and has been referred to in preceding reports.

In a preceding annual report this matter has been especially illustrated in the instance of the cable-laying steamship Faraday, while engaged in laying an electric cable between France and the United States, and holding on to the cable, found herself in the course of a cyclone which passed directly over the vessel without causing her to lose her hold of the cable, and which was at once reported by telegraph through the cable from the vessel to the European continent, the report stating wind changes and velocity, and the barometric changes occurring as the different quadrants of the cyclone passed over the vessel. The practical demonstration seems complete.

There is reason to hope that a progress has been made which will eliminate from the study of practical international meteorology some of the difficulties hitherto encountered.

There are grounds to hope also that the atmospheric conditions and changes of condition can be charted with sufficient accuracy over any extent of the earth's surface. If the hope has fruition, meteorological barriers will, as against study, cease to exist.

A second meteorological congress was held at Rome, Italy, in April, 1879. At this assembly the practical use of observations taken simultaneously, upon which use the system of this office has rested for studies and for charts for a number of years, was encouraged.

The collection of material for maps, to cover large portions of the earth's surface—interesting, by the gratuitous distribution of copies of the work of the office, to all who should, by forwarding data or material, become regular co-laborers in the office work, as has been long the usage in this country—was commended for general adoption. The daily and wide distribution of the International Bulletin and international charts is for this purpose.

The publications of the office, the Weather Review, were mentioned as models of work to be desired in Europe.

It was urged upon the United States to furnish full systems of reports from the stations on Pike's Peak and Mount Washington.

These evidences of appreciation are grateful. They go far to assure the friendly co-operation of the nations to perfect a world-wide meteorology.

The total number of daily reports, of all kinds, now received and filed at the office of the Chief Signal Officer, is as follows: Number of daily service telegraphic reports, 247; number of international daily simultaneous reports, 513; number of reports from voluntary observers, 348; number of reports received from the Medical Corps of the Army, 98; number of reports received from United States Naval Observers, 36; making a total of 1,242 reports received regularly for discussion.

Paper 28 exhibits a list of the military posts from which meteorological reports have been regularly received at this office during the year.

A list of the voluntary observers who have furnished monthly meteorological reports to this office during the year ending June 30, 1880, is exhibited in Paper 29.

As described in previous annual reports, the daily official deductions or forecasts issuing from the office of the Chief Signal Officer and constituting the tri-daily Synopses and Indications (as they are styled), and the especial deductions, in pursuance of which the orders for the display of cautionary signals at stations are given when necessary, are based upon the regular reports of the service stations of observation, transmitted tri-daily to this office by telegraph, after passing over a system of telegraphic circuits so arranged as to at once concentrate the reports at this office, and to distribute in doing so certain numbers of them at designated cities and stations. Especial reports are demanded from any station, or number of stations, whenever additional information is required as to impending disturbances. The synopses are those of the meteoric conditions existing over and near the United States for each period of twenty-four hours terminating at the hour for each general report. The indications are announcements of the changes, considered from the study of the charts, in connection with such rules and generalizations as the experience of this office and the study of meteorologists seems to have determined to be indicated as to happen within the twenty-four hours then next ensuing. The study for each issue requires the drafting and examination of eight charts, these charts exhibiting chartographically the data furnished by the simultaneous reports of the stations heretofore referred to, and located in the United States, on the Atlantic and Pacific coasts, on the coasts of the Gulf of Mexico and of the Lakes, in the western interior, and in the Dominion of Canada, Nova Scotia, Newfoundland, New Brunswick, and the West India Islands. The plans in use in this office for charting differ from any other. They are based upon the study of observations actually taken simultaneously. These charts are as follows: (Map 2.) (*a.*) A chart of barometric pressure reduced to the temperature of freezing and sea-level; of temperatures and of winds, together with the wind-directions and the velocities at the different stations; the amount, but not the nature, of the cloud formations at the different stations; the character of the precipitation, if any, occurring at the time of the reports; and the amount of precipitation, if any, since the time of the last preceding report. This chart exhibits barometric pressures and the temperatures noted at stations in their relations to districts of territory and to each other, by a system of isobaric and isothermal lines inscribed. The isobars are charted for inches and tenths of inches of barometric pressure; the isothermals for temperatures represented by the multiples of

10°. The wind-directions are shown by arrows at the different stations (Map 3.) (*b.*) A chart of the relative humidities appearing to exist over territorial districts, with the temperatures at the different stations in relation to districts and to each other. The chart of humidities enables studies to be made in reference to territorial sections, the difficulties attending the study of observations of this character being obviated to a very considerable extent by the intercorrection of stations among themselves and by the great extent of the regions over which the readings are made simultaneously. In fields so great purely local conditions in part disappear, or affect very slightly the general result. This chart contains also the character and amount of the lower clouds, and the character, amount, and direction of motion of the upper clouds, when these are visible. On this chart are traced lines of equal relative humidity, and isothermals are also drawn, as described in chart *a.* (Map 4.) (*c.*) A chart of the cloud conditions prevailing over the United States, in which the character of the different varieties of clouds and their amount, as viewed from each station, are represented graphically by appropriate symbols. On this chart also appears the weather as reported at each station at the time of each report by symbols; the stations at which rain has fallen since the preceding report, as well as the direction of movement of the upper and lower clouds, and on it each morning there are entered the minimum temperatures noted during the preceding night at the separate stations after the telegraphic observation simultaneous with 11 p. m., Washington mean time, and lines of minimum temperature are traced to exhibit these temperatures in relation to districts of territory.

The cloud areas appearing on this map are surrounded by an outline charted to enable the extent and probable movement of these areas to be considered. There also appears on the copy of this chart, made at the hour of the midnight report, the appearance of the sunset at each station, as reported by the observer at that station, and as considered by him to indicate, when taken in connection with the appearance of the western sky at sunset, the character of the weather to be anticipated at that station for the twenty-four hours next ensuing. (Map 5.) (*d.*) A chart of variation from normal pressures and of changes in these variations for each eight hours. There have been computed during past years, at this office, the means of the observed pressures recorded at each station, at each of the hours at which observations are made at that station, for the regular simultaneous telegraphic reports for each monthly period. The series of observations used in computing these means has been for as many years as was possible at each station. These mean pressures are the mean pressures computed from the actual readings had at each station, at the habitual hour of observation, for each of the tri-daily full telegraphic reports required to be made from that station, and obtained, as explained above, by reducing the readings then made to a uniform temperature—freezing—and correcting for instrumental error (variation from the standard) only. Mean pressures so obtained are styled in this office "normal pressures" for the station, for its local hour of the report, and for the month. On this chart is entered at each station, with the symbol + or −, the value by which the actual reading reported from that station at the hour of any report is above or below the "normal pressure" for that station for the hour of that telegraphic report and for that month. These deviations from such normal pressures may be styled "departures" from the normal pressure; the comparison of these departures for each period of eight hours shows what changes have taken place in the atmospheric pressure at the different stations, in each period of eight hours, after eliminating the horary variations of pressure. On the chart are traced lines of "no variation" in normal pressures, being the lines along which the pressures are at the time practically normal; also lines of "departure" from the normal pressure for each one-tenth of an inch of mercury, by which the actual readings as reported are found to be above or below the computed normal. The departures from the normal pressure in any one chart is compared with the departure for the corresponding station in the chart immediately preceding, and the change noted with its appropriate sign + or –, and lines traced to show graphically each one-tenth inch of change in pressure for each period of eight hours. This method of noting barometric pressures enables those taken and reported simultaneously from any number of different stations to be considered for purposes of study in relation to each other without reference in each case to the local questions of altitude, horary variations of pressure, or other disturbing causes at the places at which they may be taken. This chart exhibits also the wind direction as given at the hour of the daily report. (Map 6.) (*e.*) A chart of actual barometric variations. This chart exhibits the observed readings of the barometor at different stations, corrected for instrumental error (variations from the standard at Washington) and for temperature, the mercury reduced to the temperaure of freezing, but not reduced to the hypothetical readings at sea-level. In this office observed readings so treated are known as the "actual readings." On this chart are traced lines of "no variation," showing the lines along which no change in the actual readings has occurred for the periods of eight and twenty-four hours, respectively, preceding the hours of report, and also lines showing the lines of rises or falls of the actual pressure of the barometer for each one-tenth of an inch, and for the same respective periods. This chart is valuable as exibiting the nature and extent of actual barometric pressures, and the changes of such pressures, taking place at the different stations, and over the different territorial districts. (Map 7.) (*f.*) A chart of dew-point variations. On this chart there are entered the changes of the dew-point at the several stations for the periods of eight and twenty-four hours preceding the hours of report; there are traced also lines along which there has been "no variation" in dew-point during such periods, respectively, and lines showing the rises and falls for each five degrees in the dew-point for the same periods. (Map 8.) (*g.*) A chart of dew-points, vapor tensions, and actual humidity. On this chart are entered the values of the dew-point at the different stations, and lines of equal dew-point are traced for each ten degrees difference of the dew-point readings. At the extremities of these lines are noted the value of vapor tensions and actual humidity, corresponding to the given dew-point lines. The examination of the charts *f* and *g* enables the hygrometric conditions of the air and the changes in such conditions which have occurred within the periods of eight and twenty-four hours, respectively, to be considered in so far as these are indicated by the wet and dry bulb psychrometers at the different stations.

There has been prepared in the map room of the office, and to be used in connection with the studies to be had from the maps above enumerated, a colored contoured map. This map exhibits, by colored surfaces of different colors—each colored surface being bounded by contour lines—the elevations of the different terrestrial surfaces on which the stations of the Signal Service are situated, and the map exhibits as a whole the relations as to elevation of all the surfaces within the United States, Mexico, and the Dominion of Canada, over which the work of the office extends. The direction of movement of atmospheric areas may, by the study of this map, be judged of to some extent by considering the contours of the earth's surfaces over which such areas are found charted, and towards which they are thought likely to move. The linear charting has been based upon data had from Gannett's linear contour map of 1877, and from Guyot's Wall Atlas of 1863. A chart embodying additional data is now in preparation.

Several series of computations have been made in the computing-room of the office to enable additional charts each to exhibit in the lines of its charting the condensed data in their relation to each other. The regular series of computations has been continued.

The number of separate graphic chartings made and examined in the study-room, for the purpose of the daily studies of the office, during the year ending June 30, 1880, has been eight thousand seven hundred and eighty-four. The charts prepared for the issues of the Monthly Review, and exhibiting each the data received for the month and discussed for the month, have been seven in number for each month, a total of eighty-four for the year. The increase in number has been due to the addition of international charts.

The data thus accumulated on the files of this office have afforded scope for generalization differing from and perhaps more extensive in number than any before had by any one nation.

The number of reports received daily and unceasingly have necessitated a constant labor to keep up, in the discussion of them, and in the record of the results of that discussion, to the dates at which the reports are recorded, in order to prevent an accumulation which, by its mass, might lessen their usefulness. The published daily study-charts of the office and the Monthly Review, with its charts of generalizations, are examples of this work—the study-charts exhibiting a study of the data telegraphically received on each day; the charts of the Monthly Review combining the results had from these data and those received from other sources for each month during the year. It has been thus in the power of the office to lay before scientists and the public, at the close of each day, if necessary, and at the close of each month and each year, a summary for the periods then terminating. The labor of referring to the individual records in figures, which, after a time, becomes almost impracticable, is thus rendered unnecessary on the part of those who receive these papers. The charts of the average direction and velocity of movement of areas of low barometer, charts of the average barometric pressures at the hours of tri-daily report, charts of wind direction found most frequent at the different stations before rain-fall, charts of rain-frequencies for the different months, are examples of other studies of generalization. Studies of this character, and incidental to those which have in view the preannouncement of storms or other meteoric changes, furnish results valuable for practical uses.

Information of this character has been so freely and so widely furnished that it is not always considered that by no other nation is information of a similar character furnished to nearly a similar extent, and that two years ago it had not been contemplated in the United States as possible to furnish it to all.

It is by studies of this kind, and in this great field of research, that the hoped-for rules, each of which is to add its aid in the effort to attain precision of forecast and foreknowledge of climatology for the United States, are to be elaborated. It is by such rules and such knowledge, slowly but each year improving, the widest benefits of the service are to be sought. These will follow the practical use, by the people themselves, of the information gained through the work of the service, either in their attempts to have foreknowledge of coming changes from the study of their own instruments, or by supplementing that study by reference to the daily-published bulletins and reports of this office. There is hardly a class of the people, or an industry they practice, but to which good may, in this way, and from such studies, result. Enough has already been done to prove that it is possible.

The policy pursued by the office of diffusing as widely as possible, and in condensed form, the information in its possession, and that of extending the scope of its observations, enables it to benefit, in studies like these, by the labors of students everywhere. The results returned to the office, in the able suggestions made by distinguished scholars who have received its publications, and based upon deductions had from the charts and data so furnished, aid in forming the rules on which its duties rest. The list of correspondents to whom the publications of the office are furnished contains the names of many of the leading scholars and scientific men in different parts of the world. The instances are not infrequent in which the most interesting papers upon the subject of meteorology, read before the most distinguished and learned societies in the United States, have rested for their value almost wholly upon the studies of the data of observations and the charts prepared at and furnished from this office.

The search for generalizations or the support of theories becomes comparatively easy when the material is furnished in elaborate form, requiring little more than collation for either.

The Synopses and Indications have been furnished for the press at the regular hours, 1 o'clock a. m., 10.30 a. m., and 7.30 p. m., daily, and under the same rules as in preceding years. There has been no failure in the delivery of any report during the year. The total number of statements thus issued for publication has been one thousand and ninety-eight. These have been telegraphed at the moment of their issue to the principal cities, and have appeared in some form in almost every journal in the United States. A careful analysis of these statements of the office, made for the year terminating June 30, 1880, and a comparison with the meteoric conditions afterwards occurring within the twenty-four hours next ensuing, and within the district to which each forecast has had reference, has given a percentage of verification as follows:

Reference is had to the district map.

Percentage of verifications for each month of the year ending June 30, 1880.

	1879.						1880.					
	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	April	May.	June.
New England	83.9	85.9	87.7	85.8	93.1	89.4	85.8	88.3	85.5	81.6	77.4	86.6
Middle States	89.1	86.6	90.3	89.5	91.5	84.7	85.8	92.2	86.6	84.7	82.6	87.1
South Atlantic States	82.3	81.9	88.8	87.3	90.6	85.1	84.4	86.7	87.0	83.5	90.4	92.5
Eastern Gulf States	80.8	85.0	89.2	87.9	92.3	85.9	80.7	88.8	84.4	83.9	87.7	91.9
Western Gulf States	82.5	84.7	88.9	85.2	88.7	85.6	80.7	87.9	79.4	81.8	86.2	92.6
Lower Lakes	87.7	85.8	88.3	88.2	91.2	87.8	84.3	90.2	87.3	84.5	80.6	89.9
Upper Lakes	86.3	82.6	90.8	89.5	92.4	84.4	87.8	88.2	87.1	79.9	81.5	86.0
Tennessee and Ohio Valley	82.4	84.5	89.9	88.2	92.4	83.9	84.9	87.2	83.7	84.9	83.0	90.4
Upper Mississippi Valley	87.6	81.0	89.8	84.0	87.2	86.2	84.9	84.0	85.6	80.9	80.7	85.2
Lower Missouri Valley	85.0	80.3	87.5	85.0	97.5	83.9	84.7	85.3	87.2	76.8	77.3	83.4
Total percentage of verifications	85.1	84.0	89.3	86.3	90.8	85.7	84.4	88.0	85.4	82.2	82.7	88.6
Percentage of verifications for the year (changes of barometric pressures, temperatures, wind-direction, and character of weather expected) comprised												86.04
Percentage of verifications for the year (forecasts of the character of the weather only)												90.3

The percentages of accuracy first above given are for statements comprising the predictions of the changes of barometric pressures, temperatures, wind-directions, as well as the character of weather to be expected in the districts to which they have reference. Such predictions are more difficult to make correctly than those relating to the future conditions of the weather alone, for in such forecasts it must be preannounced for twenty-four hours for each district outlined upon the map, whether in that particular district the barometric pressures will increase or diminish; whether the temperatures will rise or fall; what in each district will be the wind-directions, and other statements far more difficult to make accurately than the general forecasts that the skies will be clear or cloudy, and with and without rain. The percentage of accuracy of forecasts limited to the preannouucement of the character of the weather to be expected in the districts, exclusive of the other conditions above referred to, has been 90.3.

Percentage of verifications for the Pacific coast region for the months given.

	1879.						1880.					
	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	April	May.	June.
Northern Pacific region	91.7	85.8	89.3	65.7	95.0	87.5	84.7	92.6	77.5	86.1	84.2	77.0
Central Pacific region	100.0	95.7	100.0	95.2	98.3	86.6	90.3	93.1	87.5	83.9	85.5	100.0
Southern Pacific region	100.0	100.0	100.0	100.0	97.5	88.3	96.0	92.9	88.3	83.9	87.5	100.0
Total percentage of verifications	97.2	93.8	96.4	86.9	96.9	87.5	90.3	92.9	84.4	84.6	85.7	92.3
The indications for the Pacific coast are for the "weather" only, and for the period made, the general percentage is												90.74

There was need of much deliberation and practice before it was deemed wise to attempt the work of forecasts for the great extent of coasts bordering upon the Pacific Ocean. Tradition had held it to be impossible to accurately announce approaching changes for any coast fronting westward with sea surfaces only beyond it. The stations upon the coast under consideration are yet few, the telegraphic communication difficult, the contours of the earth's surface broken by abrupt and great changes of elevation, the stations lying back from the coast so difficult to reach as to be almost useless. It has been found, however, that the facilities for study now provided in the study-room of the office enable changes approaching from the seaward to be considered by their effects on land, and studies to be made as to what sequences at sea and upon the coast must follow conditions exhibited upon the charts as existing in the interior. The results of such studies are exhibited by the statement of verifications submitted above. This work is not without its reference to future work upon the oceans. Map 9 exhibits the districts into which this region has been divided for purposes of this study.

The attempt has been continued to utilize the statements of indications issued in bulletin form by adding, when possible, precise information as to the location of areas of disturbance or storm-centers, their expected direction of movement, and such other facts as might be stated fully on the bulletins to be displayed at boards of trade rooms and other prominent points in cities, and be of utility both as amplifying the reports of indications furnished for the press, and also as capable of being issued from the central office at any hour it might be considered necessary so to issue them. The press reports are habitually furnished at fixed hours only. At these hours important and sometimes great atmospheric changes may seem to be only slightly indicated, when such changes afterward develop rapidly. It is sometimes not possible to preannounce them in any other than the bulletin form. The popular faith in the announcements of the office, now in the tenth year of their issue, has not diminished. So far as can be judged from reports, notably more attention has been paid to the announcements among the farming population. There seems each year more confidence and a greater willingness to be guided by the statements of forecasts in the conduct of agricultural operations. The increase in the proportional amount of the wheat product this year has been commented upon by the local press in some portions of the country as to some extent due to the accuracy of the weather reports furnished the farmers daily.

This confidence of the people, as a whole, has not been sensibly lessened at any time by the errors and omissions which sometimes direct attention to the fact that in the present condition of science, and with a system of observation still too limited, premonitions having for their scope a territory so great as that of the whole United States, and embracing the coasts of two oceans, cannot always be correct for every part of a district.

The reports of forecasts are necessarily limited also to a certain number and few telegraphic words, the report for a district comprising several States being condensed into four or five lines, every word of which must be paid for.

It is not possible always to describe within this limit of description weather changes clearly indicated as to occur, but notice of which must be omitted for want of space. It would not be difficult to write for each State, and with benefit to the readers, a synopsis with the forecasts stated in numbers of words equal to the whole number now allowed for those relating to all the States of the Union.

The Indications are not always correctly understood by those who read them; the error of mistaking the announcement made for one district, as set forth on the District Map, as applying to a district differently located is frequent. Every effort is made to render the division of the country into districts for purposes of description properly understood.

The popular knowledge of the duties of the office, and its reasonable success in discharging them, is in no way better evidenced than by the criticisms to which it is subjected if errors occur in the work. It is not many years since the work itself was, at home and abroad, deemed impracticable. In more recent criticisms the work has been commented upon adversely and severely, because even occasional errors happen. It has seemed to be considered that it ought never to fail. There has been no work other than that of this office to cause such success to be popularly expected. Criticisms of this kind are, by the general accuracy they imply, a source of satisfaction.

The instruction of officers of the Signal Service to fit them for the various duties of the office has been continued. The especial duties in which the officers on duty are severally engaged, each in his sphere, and each of which duties contributes its share to the success of the whole, are such as necessarily prepare them for the course of especial study and practice, and fit them to take charge, in turn, of the separate divisions and sections into which the office work is divided. A roster for duty becomes in this way possible, and provides at once for the permanent continuance of the work to be prosecuted both by day and at night, by providing for the relief of men wearied in the discharge of such parts of the duty as impose severe physical as well as mental strain by others fresh from duties less burdensome. It insures also the instant filling of vacancies in the cases of sickness or absence of any officer.

The studies to which reference has been hitherto made and the data condensed for generalization improve each year the material had in the office for study.

In the incessant work of the map-room, and in making the computations constantly called for in the course of office duty, important assistance is rendered by the competent and well-taught non-commissioned officers and soldiers on duty in the several divisions. In the matter of arriving at generalizations it would be impossible often to handle the masses of data which must be considered without the faithful service of these men. While absolute accuracy cannot be expected in work so extensive as that required from this office, and the results of which are demanded for instant publication, there is attained an accuracy sufficient for every practical purpose, and one which each year increases in rigor.

The data which appear in the publications of this office are checked figure by figure five times before the printing. These are, wherever it is practicable, accompanied by a chart, useful in itself, and by the charting the best check upon all the data which have served as its bases. Additional checks are adopted whenever experience has demonstrated a closer accuracy can be had.

The display of cautionary day and night signals, by flags by day, and lights by night, has been made systematically as occasions of supposed especial danger at the following points, ports and harbors located upon the lakes, the Atlantic and the Gulf coasts:

Alpena, Mich.; Atlantic City, N. J.; Ashtabula, Ohio; Baltimore, Md.; Barnegat, N. J.; Bay City, Mich.; Booth Bay, Me.; Boston, Mass.; Buffalo, N. Y.; Cape Hatteras, N. C.; Cape Henry, Va.; Cape Lookout, N. C.; Cape May, N. J.; Cape Vincent, N. Y.; Cedar Keys, Fla.; Charleston, S. C.; Charlevoix, Mich.; Charlotte, N. Y.; Chatham, Mass.; Chicago, Ill.; Chincoteague, Va.; City Island, N. Y.; Cleveland, Ohio; Deer Island, Me.; Delaware Breakwater, Del.; Detroit, Mich.; Duluth, Minn.; Dunkirk, N. Y.; Eastport, Me.; East Tawas, Mich.; Erie, Pa.; Escanaba, Mich.; Fairport, Ohio; Fall River, Mass.; Forrester, Mich.; Fort Macon, N. C.; Frankfort, Mich.; Galveston, Tex.; Gloucester, Mass.; Grand Haven, Mich.; Green Bay, Wis.; Highland Light, Mass.; Horn's Pier, Wis.; Houghton, Mich.; Hyannis, Mass.; Indianola, Tex.; Jacksonville, Fla.; Kenosha, Wis.; Kewaunee, Wis.; Key West, Fla.; Kittyhawk, N. C.; Lewes, Del.; Ludington, Mich.; Mackinac City, Mich.; Manitowoc, Wis.; Marblehead, Mass.; Marquette, Mich.; Menomonee, Mich.; Milwaukee, Wis.; Mobile, Ala.; Monroe, Mich.; Muskegon, Mich.; New Bedford, Mass.; Newburyport, Mass.; New Haven, Conn.; New Haven Light, Conn.; New London, Conn.; New Orleans, La.; Newport, R. I.; New York City; Norfolk, Va.; Northport, Mich.; Oswego, N. Y.; Pensacola, Fla.; Pentwater, Mich.; Port Austin, Mich.; Port Eads, La.; Port Huron, Mich.; Portland, Me.; Portsmouth, N. H.; Provincetown, Mass.; Racine, Wis.; Rochester, N. Y.; Rockland, Me.; Rogers City, Mich.; Saint Joseph, Mich.; Saint Marks, Fla.; Sand Beach, Mich.; Sandusky, Ohio; Sandy Hook, N. J.; Savannah, Ga.; Sheboygan, Wis.; Smithville, N. C.; South Haven, Mich.; Stonington, Conn.; Sturgeon Bay, Wis.; Thatcher's Island, Mass.; Toledo, Ohio;

Traverse City, Mich.; Tybee Island, Ga.; Wilmington, N. C., and Wood's Holl, Mass.

During the year ending June 30, 1880, two thousand eight hundred and thirty-five signals have been ordered, counting each separate display at each port as a separate signal, in anticipation of one hundred and five dangerous storms.

Of the number of cautionary signals displayed, eighty-two and four-tenths per cent. have been afterward reported as justified by the occurrence of winds, &c.

Of the number of off-shore signals displayed, eighty-seven per cent. have been afterward reported as justified.

The following table exhibits the number of signals (cautionary and off-shore) ordered during each month, and the percentage of verifications for each month; also the total number of signals ordered during the year, with the total number verified and annual percentage of verifications:

Month and year.	Cautionary signals.	Verified.	Per cent.	Cautionary off-shore signals.	Verified.	Per cent.	Total number of signals.	Total number verified.	Per cent.
1879.									
July	98	82	83.7	0	0	0.0	98	82	83.7
August	87	73	83.9	13	13	100.0	100	86	86.0
September	170	117	68.8	29	19	65.5	199	136	67.3
October	166	114	68.7	51	44	86.3	217	158	72.8
November	236	219	92.8	82	80	97.6	318	299	94.0
December	270	220	81.5	82	63	76.8	352	283	80.4
1880.									
January	160	119	74.4	46	40	87.0	206	159	77.2
February	166	156	94.0	107	98	91.6	273	254	93.0
March	260	225	86.5	94	85	90.4	354	310	87.6
April	292	254	87.0	104	91	87.5	396	345	87.1
May	188	142	75.0	33	27	81.8	221	169	76.5
June	89	76	85.4	12	8	66.7	101	84	83.2
Totals	2,182	1,797	82.4	653	568	87.0	2,835	2,365	83.4

Of the total number of cautionary and off-shore signals thus displayed, eighty-three and four-tenths per cent. have been afterward reported as justified by the occurrence of winds held to warrant them at the points where the signals were displayed, or within the radius of one hundred miles distant of these points, as set forth in the rules of the office. In the cases reported as failures of justification following the display, the winds did not attain, at the port or within the described radius, a violence held to justify the warning. The signal ordered by this office is always cautionary in its character, not announcing that a storm will come, but that the indications are sufficiently threatening to call for caution, both as to going to sea and preparation for rough weather if vessels are about to sail.

The following tables show the location of the cautionary and cautionary off-shore signal display stations under the direction of the office of the Chief Signal Officer, the date on which each was established, the names of the displaymen, the number of cautionary and cautionary off-shore signals displayed, the number reported justified, and the number reported not justified, from July 1, 1879, to June 30, 1880, except in cases where they were established subsequent to July 1, 1879:

SECTION No. 1, ON OR NEAR LAKE MICHIGAN.

Stations.	Date of establishment.	Name of displayman.	Cautionary signals.			
			Number ordered displayed.	Number reported justified.	Number reported not justified.	Number not reported upon.

The station at Lewes was transferred to Delaware Breakwater January 27, 1880.
Pensacola became a station of the first class October 27, 1879.

It is one of the most difficult tasks which fall to the office to determine in advance over what ports to be selected, to the exclusion of others, an advancing storm-area will pass, and in such a manner as to be accompanied at these ports with a given wind-velocity. The direction of movement of storm-areas changes sometimes unexpectedly, and ports are then threatened at which, while the signal may be exhibited, it cannot be shown far enough in advance to avoid the coming danger. Within the same area the winds differ in force at different points. They differ also with different contours of the earth's surface. There is the danger that warnings unnecessarily given may delay the movements of shipping. A heavy responsibility is incurred if the warnings are not given when they ought to be. Time, increasing experience, and increasing facilities will insure improvement.

The storm of a storm-area with wind registering a wind-velocity of twenty-five miles per hour on land, indicating, as it frequently does, a wind-velocity of forty-five or fifty miles at a distance of ten or twenty miles from the land, is regarded as the lowest velocity justifying a signal.

There is no work of the office in which it has been felt necessary to progress with more caution than in that relating to the display of cautionary signals. None had ever been shown in the United States when the duty of making such displays devolved upon this office, and it was in debate whether any had ever been shown with practical success elsewhere.

Two classes of signals, the cautionary signal and the cautionary off-shore signal, are in use on the coasts of the United States. The "cautionary signal," *i. e.*, a red flag with black square in the center by day, or a red light by night, calls for caution in view of an approaching storm, and is so "cautionary" with reference to winds blowing from any direction. The cautionary off-shore signal, *i. e.*, a white flag with black square in the center, shown above a red flag with black square in the center by day, or a white light shown above a red light by night, is "cautionary" with reference to winds expected to blow from a northern or western direction, or off-shore, at or near the place at which it may be displayed. This latter signal is displayed at and on the regular place and staff, and consists of a *white flag with a square black center* shown above a *red flag with a square black center* by day, or a *white light* shown above a *red light* by night. This signal is known as the "cautionary off-shore signal," and indicates, when shown, that while the storm disturbance is considered at the office of the Chief Signal Officer as not yet passed for the port or place at which the signal is displayed, and the winds may yet be high, and there may be danger, the winds are expected to blow from a northern or western direction or "off-shore," at or near the port or place where the signal may be.

The display of this signal will often follow and must be distinguished from the display of the usual "cautionary signal," *i. e.*, a square red flag with a square black center by day or a red light shown at night, which retains, when shown alone, its usual meaning. The display of either is always cautionary.

It is of important utility in the management of vessels and for the safety of them to be thus preadvised as to the direction in which coming winds will blow.

The plan for subordinate stations at which cautionary signals might be displayed (systems of these stations being managed as subordinate to and in connection with the signal stations of the first class, established at the principal cities and ports of the United States, and immediately controlled from this office) has been continued in operation. As described in the last annual report these subordinate stations are known as "display-stations." They are located at the smaller lake or sea-ports, and are classed several together in sections. Each section is numbered as "Section One," "Section Two," &c., and is under the immediate supervision of a sergeant of the Signal Corps, located at a named station at some neighboring principal port. The duties at display-stations are limited to this display, upon the receipt of the telegraphic order by day or at night, of the cautionary signals or cautionary off-shore signals.

Since the date of the last annual report additional display-stations have been established on Lakes Huron, Michigan and Superior, as follows: In Section Three, controlled from Detroit, Mich., Charlevoix, Mich., August 1, 1879. In Section Four, controlled from Detroit, Mich., Sand Beach, Mich., September 20, 1879; Houghton, Mich., August 1, 1879. Signals are displayed when ordered direct from this office. On the sea-coast as follows: In Section Eight, Provincetown, Mass., September 1, 1879, and Fall River, Mass., February 17, 1880. The display of signals at the latter station had been suspended since May 12, 1879. Of signals displayed at display-stations, the record shows 65 per cent. considered verified at the stations themselves.

Before the organization of the display system, signals were displayed at forty-six ports only; they are now displayed, when need be, at one hundred and six ports.

The warnings of the service have been doubled in utility by the adoption of the off-shore signal and the organization of the system of display-stations.

An additional safeguard is offered on the lake coasts, where either full signal stations or display-stations exist, by the fact that whenever it is found necessary to display a warning signal of any character upon any station on those coasts, notice and warning of the fact is announced by telegraph at every other station along the lakes.

There are no other coasts so fully guarded by the display of storm signals as are now those of the United States.

A completeness of work, which a few years ago seemed not to be attainable on the part of the office for many years, is, by the experience gained in those duties within the few years past, already accomplished.

If the duties of this office are done and its warnings exhibited at its warning stations as they ought to be, the record of disasters cannot fail to show, by the lessened number of them, the good effects of this watchful care. It is a pleasant thought that the protecting vigilance of the United States is offered in this regard, and in all matters pertaining to this duty, equally to the shipping of every foreign people with the shipping of its own.

Compilations of statistics have been made to determine definitely, and to the satisfaction of the office, what certain benefits to shipping have followed the displays of cautionary signals. A series of tables of disasters to shipping, compiled for a number of years, have seemed to show that the annual average of disasters occurring at or near points at which cautionary signals have been displayed has been lessened by a considerable percentage for the years during which the displays have been had. The discrimination made by insurance companies against insurance risks, taken for the sea and lake-ports and places which have no signal stations, exhibits, by the increased pecuniary consideration demanded for such risks, amounting in the aggregate to a very considerable sum, an evidence of appreciation of the value of them. The reports of the observers at stations give instances in which numerous vessels have remained in different ports in recognition of the warnings given. In these cases danger has been avoided. In other cases the displays of signals on dangerous coasts have been followed by the making to sea for an offing of all of the vessels in sight of the display. In other instances reported, vessels going to sea in disregard of the warnings have been driven back, have suffered injury, or have been lost. So far as can be judged at this office, a proper attention is paid to its warnings, particularly on the part of the coasting or smaller classes of vessels on the seacoast, and by shipping generally on the lakes. Especially does this happen at those times of the year recognized by seamen as the stormy seasons.

During the year ending June 30, 1880, four hundred and thirty-five storm warnings for Canadian stations were telegraphed from this office to the Superintendent of the Dominion Meteorological Service, at Toronto, Canada. The uses made of these warnings, or their results when displayed, have not been communicated to this office.

The plan of exhibiting as widely as possible in the agricultural districts throughout the United States the results of the daily office studies in the form of printed forecasts for the benefit of the agricultural populations, frequently described in former reports, has been continued in operation. The effort to cover so wide an extent of territory has made the labor great. The continuance of the work has seemed to be warranted by the favor with which it has been received. It has been considered due to the farming populations that they should have an opportunity to profit by whatever information could be given them. With the active co-operation of the Post-Office Department, with which there is an arrangement for this purpose, six thousand one hundred and sixty-seven printed Farmers' Bulletins, on which have appeared daily the reports of this office, have been distributed and displayed in frames daily at as many different cities, villages, and hamlets in different States. There are numerous and especial requests to increase this number. At 1 o'clock a. m. of each day, except Sunday, the midnight report of the office for the ensuing day has been telegraphed during the year ending June 30, 1880, to seventeen centers of distribution, located in the following-named cities: Albany, N. Y., 265; Bangor, Me., 163; Boston, Mass., 659; Buafflo, N. Y., 280; Burlington, Iowa, 189; Chicago, Ill., 634; Cincinnati, Ohio, 543; Des Moines, Iowa, 62; Detroit, Mich., 335; Leavenworth, Kans., 45; Logansport, Ind., 185;* Memphis, Tenn., 16; Nashville, Tenn., 97; New York, N. Y., 719; Pittsburgh, Pa., 312; Philadelphia, Pa., 827; Saint Louis, Mo., 366. Four hundred and seventy copies of the bulletin are also issued daily from the central office in Washington. In addition thereto a miscellaneous issue of five hundred copies is made at the several printing stations above mentioned. At five of these stations the bulletins are printed by civilian employés upon the office presses, and under the immediate supervision of the sergeants in charge. At the other thirteen stations the work is wholly done by enlisted men of the Signal Corps.

The numbers placed after the names of the cities denote the number of hamlets, post-offices, or railway stations supplied from each city as a center.

These centers have been carefully chosen as in the midst of the denser agricultural populations of the United States, and at points whence the facilities of communication would enable the surrounding districts to be most rapidly supplied.

---

* The printing of the Farmers' Bulletins at Memphis was discontinued April 7, 1880. Since that date it has been written in manifold.

The telegraphic report of forecast telegraphed from the central office at 1 a. m. of each day, and received at a center of distribution, is at once there printed on bulletin forms provided for that purpose. These are enveloped as rapidly as printed, addressed to each designated post-office within the district to be supplied, and which can be reached by the swiftest conveyance by the hour of 2 p. m. of the date, and are then placed in charge of the Post-Office Department under an arrangement by which each postmaster receiving a bulletin has the order of the Postmaster-General to display it instantly in a frame furnished by this office for that purpose, and to report in writing the fact and time of its receipt and its display to the Chief Signal Officer.

The bulletins have reached the different offices and have been displayed in each of the frames at the average hour of 11 a. m., averaging thus ten hours from the time the report has left the office of the Chief Signal Officer until it has appeared bulletined in the midst of the farming populations, and accessible to them in the distant parts of the country.

The information given on these bulletins has a value in addition to the forecasts. Facts relating to the climatology of the different sections are condensed into brief notes, which are published with the telegraphed reports. For instance, each bulletin announces for the geographical district in which it is displayed, and in addition to the forecast for the day, what winds in each month have been found most likely and what least likely to be followed by rain at the stations within each district. The simple foot-note has its effect in increasing the gains and reducing the losses of harvesting.

These bulletins will improve for the uses for which they are intended as the experience of the office permits the information they exhibit to be supplemented with further data and other rules. With each year the popular knowledge of the uses of the bulletin and some increased interest in and study of meteorology render the farming communities better able to judge of its correctness and to benefit by its contents. It is contemplated, as the work of the office progresses, to add to the bulletins such brief instructions as may be developed in regard to its uses in connection with such local instruments as may be had for local use. Reference has been made in preceding reports to the economy of this work. Careful estimates have shown that if the total cost for each bulletin station at which the bulletin is displayed at each different post-office, hamlet, village, or city were computed to be 27 cents per day, the sum so resulting would meet all the expenses caused by the Signal Service. A little saving of any one crop of grain to any interest, made on any one day in the vicinity of each station, supposing nothing to be saved on any other day of the year at or near that station, would more than counterbalance the expenditure.

The distribution of the instrument known as the Weather Case, or Farmers' Weather Indicator, has been continued. Brief rules for use accompany each instrument. (Paper 30.) This instrument will supplement with local signs and with the local indications of the several instruments; it combines in simple form the general indications given in the bulletin reports. It will, it is hoped, enable agriculturists and others to determine for themselves in advance something as to the character of the coming weather from local indications alone, when added means of information cannot be reached or may fail.

Whenever appropriations at the control of the office shall make it possible to publish, to accompany the Farmers' Bulletin, or in the columns of newspaper journals, graphic weather charts, simply drawn and so explained as to be comprehended as to their meaning by persons of ordinary education without special study, the use, it is to be hoped, of instruments of this character will be found very available. The use of the Weather Case alone at isolated places, where other reports or information other than that had from the readings and the use of the instrument itself cannot be had, will, with little practice, fill a want long felt among the agricultural populations, and often afford to them valuable results. It cannot fail to turn thought and study in a useful direction.

It is in contemplation, when the amounts of the appropriations for the service and its strength permits, to place such instruments, should experience warrant, both at the farmers' post-offices now reached by the Farmers' Bulletin and at others not reached by either the bulletin, the daily press, or the telegraph, for the use of the farming population.

The railway bulletin service has been increased during the year, and continues to give satisfaction as a rapid means of disseminating the Indications issued from this office. As stated in the last annual report, this service is established on lines of railway, which have entered into an arrangement with the War Department, by which they receive at the time of the midnight report and by telegraph a copy of the office report, then made. This is the most important report of the day, the report exhibiting the Synopses and Indications, which appear so generally published in the columns of the daily journals. The report received by the railway companies is at once distributed under the direct supervision of the superintendents of the companies and of the railway telegraphs to designated railway stations along the several railway lines; ninety-five railway companies, with a total of two thousand eight hundred and eighty-nine railway stations, are now coöperating in this service. The report received at a railway station is by standing order of the railway officers immediately there bulletined by the railway agents on forms provided by this office, and check reports are made by the agents to this office in order that the attention of superintendents may be called to any delay or error in the work. The work is yet in its infancy, but promises to be of great utility. It is capable of indefinite extension, and will exhibit the forecasts of this office daily, in a few hours after their issue, to the traveling public and the vast number of farmers and other residents in the great extent of country through which the railway lines pass, and which could not be otherwise reached. The railway companies rendering this service to the United States, without charge, are not rendering a gratuitous service. A benefit is returned to them in the full knowledge given the managers of the railway lines of the weather conditions prevailing upon them. A further benefit comes to the companies that they render everywhere to the homes of the people, in the midst of which the lines pass, a daily service recognized with gratitude. The companies which have entered into this coöperation with the service, with the number of stations on each, are as follows:

Chicago, Burlington and Quincy Railroad, T. J. Potter, superintendent, Burlington, Iowa, 258 stations; Pittsburgh, Cincinnati and Saint Louis Railroad, D. W. Caldwell, superintendent, Columbus, Ohio, 55 stations; Scioto Valley Railroad, J. B. Peters, superintendent, Columbus, Ohio, 11 stations; Marietta and Cincinnati Railroad, John Waddle, superintendent, Cincinnati, Ohio, 9 stations; Cairo and Saint Louis Railroad, L. M. Johnson, superintendent, Saint Louis, Mo., 19 stations; Alleghany Valley Railroad, David McCargo, superintendent, Pittsburgh, Pa., 34 stations; Atchison, Topeka and Santa Fé Railroad, W. B. Strong, superintendent, Topeka, Kans., 43 stations; Kansas City, Saint Joseph and Council Bluffs Railroad, George H. Nettleton, superintendent, Kansas City, Mo., 11 stations; Kansas City, Lawrence and Southern Railroad, H. C. Sprague, superintendent of telegraph, Kansas City, Mo., 19 stations; Atchison and Nebraska Railroad, H. W. Forman, superintendent of telegraph, Atchison, Kans., 25 stations; Kansas City, Fort Scott and Gulf Railroad, H. C. Sprague, superintendent of telegraph, Kansas City, Mo., 20 stations; Saint Louis and Southeastern Railroad, J. H. Wilson, superintendent, Evansville, Mo., 22 stations; Chicago and Northwestern Railroad, W. H. Stennet, superintendent, Chicago, Ill., 87 stations; Pittsburgh, Fort Wayne and Chicago Railroad, C. E. Gorham, superintendent, Pittsburgh, Pa., 35 stations; Cleveland, Columbus, Cincinnati and Indianapolis Railroad, E. B. Thomas, superintendent, Cleveland, Ohio, 35 stations; Indianapolis, Cincinnati and Lafayette Railroad, M. E. Ingalls, superintendent, Cincinnati, Ohio, 21 stations; Chicago and Alton Railroad, J. C. McMullen, superintendent, Chicago, Ill., 99 stations; Chicago and Eastern Illinois Railroad, O. S. Lyford, superintendent, Chicago, Ill., 25 stations; Central Iowa Railroad, D. E. Pickering, superintendent, Marshalltown, Iowa, 11 stations; Burlington, Cedar Rapids and Northern Railroad, J. D. Fox, superintendent of telegraph, Cedar Rapids, Iowa, 66 stations; Trans-Ohio Division (Baltimore and Ohio Railroad), D. H. Hudson, superintendent, Chicago, Ill., 62 stations; Saint Louis, Vandalia, Terre Haute and Indianapolis Railroad, J. E. Simpson, superintendent, Cincinnati Ohio, 21 stations; Milwaukee, Lake Shore and Western Railroad, H. G. H. Reed, superintendent, Milwaukee, Wis., 10 stations; Saint Louis and San Francisco Railroad, Capt. C. W. Rogers, superintendent, Saint Louis, Mo., 37 stations; Detroit, Lansing and Northern Railroad, J. B. Mullikin, superintendent, Detroit, Mich., 10 stations; Louisville, Nashville and Great Southern Railroad, D. W. C. Rowland, superintendent, Louisville, Ky., 39 stations; Evansville, Terre Haute and Chicago Railroad, Joseph Collett, superintendent, Terre Haute, Ind., 7 stations; Evansville and Terre Haute Railroad, J. E. Martin, superintendent, Evansville, Ind., 8 stations; Fort Wayne, Muncie and Cincinnati Railroad, W. W. Worthington, superintendent, Fort Wayne, Ind., 13 stations; White Water Railroad, W. W. Worthington, superintendent, Fort Wayne, Ind., 5 stations; Fort Wayne, Jackson and Saginaw Railroad, R. B. Loomis, superintendent, Jackson, Mich., 13 stations; Toledo and Ann Harbor Railroad, George L. Peck, superintendent of telegraph, Toledo, Ohio, 6 stations; Cleveland, Mount Vernon and Columbus Railroad, General G. A. Jones, superintendent, Mount Vernon, Ohio, 9 stations; Cincinnati, Sandusky and Cleveland Railroad, D. W. C. Brown, superintendent, Sandusky, Ohio, 16 stations; Northwestern Grand Trunk Railroad, Charles B. Peck, superintendent, Port Huron, Mich., 22 stations; Southern Minnesota Railway, P. M. Myers, superintendent, LaCrosse, Wis., 41 stations; Old Colony Railroad, James H. French, assistant superintendent, Boston, Mass., 108 stations; Detroit, Grand Haven and Milwaukee Railroad, W. J. Morgan, assistant superintendent, Detroit, Mich., 4 stations; Eastern Railroad, E. B. Phillips, president, Boston, Mass., 54 stations; Buffalo and Southwestern Railroad, John F. Moulton, superintendent, Buffalo, N. Y., 8 stations; New York, Pennsylvania and Ohio (formerly Atlantic and Great Western Railroad), J. H. Devereux, receiver, Cleveland, Ohio, 22 stations; Boston and Albany Railroad, Charles O. Russell, superintendent, Springfield, Mass., 14 stations; New York Central and Hudson River Railroad, J. M. Toucey, superintendent, New York City, N. Y., 31 stations; Portland and Rochester Railroad, George P. Wescott, receiver, Portland, Me., 7 stations; Richmond, Fredericksburg and Potomac Railroad, Maj. E. T. D. Myers, superintendent, Richmond, Va., 6 stations; Richmond and Danville Railroad, Col. T. M. A. Talcott, superintendent, Richmond, Va., 12 stations; Camden and Atlantic Railroad, F. A. Lister, superintendent, Camden, N. J., 12 stations; Philadelphia, Wilmington and Baltimore Railroad, H. F. Kenny, superintendent, Philadelphia, Pa., 43 stations; Philadelphia and Reading Railroad, Franklin B. Gowan, receiver, Philadelphia, Pa., 85 stations; Grand Rapids and Indiana Railroad, F. A. Gorham, auditor, Grand Rapids, Mich., 64 stations; Portland and Ogdensburgh Railroad, Jonas Hamilton, superintendent, Portland, Me., 5 stations; Maine Central Railroad, Payson Tucker, superintendent, Portland, Me., 12 stations; Cumberland Valley Railroad, I. T. Boyd, superintendent, Chambersburg, Pa., 9 stations; Atlantic, Mississippi and Ohio Railroad, Col. Frank Huger, master of transportation, Lynchburg, Va., 14 stations; Mobile and Montgomery Railroad, Capt. E. L. Tyler, superintendent, Montgomery, Ala., 17 stations; Connecticut Central* Railroad, D. D. Warren, president, Springfield, Mass., 7 stations; Baltimore and Ohio Railroad, Chas. A. Tinker, superintendent, Baltimore, Md., 37 stations; Huntingdon and Broad Top Railroad, G. F. Gage, superintendent, Huntingdon, Pa., 6 stations; Northern Central Railway Company, G. C. Wilkins, superintendent, Baltimore, Md., 9 stations; Baltimore and Potomac Railroad, G. C. Wilkins, superintendent, Baltimore, Md., 5 stations; West Jersey Division Pennsylvania Railroad, General W. J. Sewell, general superintendent, Camden, N. J., 20 stations; Frederick Division, Pennsylvania Railroad, H. H. Carter, superintendent, York, Pa., 13 stations; Elmira and Canandaigua Division, Pennsylvania Railroad, Robert Neilson, superintendent, Elmira, N. Y., 20 stations; Philadelphia and Erie Division, Pennsylvania Railroad, William A. Baldwin, general superintendent, Williamsport, Pa., 31 stations; Main Line Philadelphia to Pittsburgh, Pennsylvania, Railroad, Charles C. Pugh, general superintendent, Altoona, Pa., 94 stations; New York Division, Pennsylvania Railroad, James McCrea, superintendent, Jersey City, N. J., 36 stations; Belvidere Division, Pennsylvania Railroad, John Anderson, superintendent, Lambertville, N. J., 14 stations; Amboy Division, Pennsylvania Railroad, J. S. Buckelew, superintendent, Camden, N. J., 24 stations; Boston and Maine Railroad, J. F. Furber, superintendent, Boston, Mass., 34 stations; Boston and Providence Railroad, A. A. Folsom, general superintendent, Boston, Mass., 15 stations; New York and New England Railroad, H. M. Britton, superintendent, Boston, Mass., 16 stations; Boston, Revere Beach and Lynn Railroad, E. H. Whorf, superintendent, Boston, Mass., 9 stations; Lehigh Valley Railroad, R. H. Sayre, superintendent, Bethlehem, Pa., 28 stations; Indianapolis, Bloomington and Western Railroad, B. S. Henning, superintendent, Indianapolis, Ind., 24 stations; Providence and Worcester Railroad, W. E. Chamberlain, superintendent, Providence, R. I., 13 stations; Boston, Barre and Gardner and Monadnock Railroad, H. M. Witter, superintendent, Worcester, Mass., 19 stations; Marietta, Pittsburgh and Cleveland Railroad, S. C. Baldwin, superintendent, Marietta, Ohio, 16 stations; Carolina Central Railroad, Dr. C. Roberts, superintendent, Wilmington, N. C., 9 stations; Savannah and Charleston Railroad, C. S. Gadsden, superintendent, Charleston, S. C., 6 stations; Southern Central Railroad, James G. Knapp, superintendent, Auburn, N. Y., 21 stations; Boston and Lowell Railroad, A. A. Hobart, superintendent, Boston, Mass., 13 stations; Little Miami Division of Pittsburgh, Cincinnati and Saint Louis Railroad, J. D. Ellison, superintendent, Cincinnati, Ohio, 10 stations; Mississippi and Tennessee Railroad, M. Burke, superintendent, Memphis, Tenn., 9 stations;

* Transferred to New York and New England Railroad June 1, 1880.

Memphis and Charleston Railroad, J. A. Grant, superintendent, Memphis, Tenn., 12 stations; Indianapolis, Peru and Chicago Railroad, V. T. Malott, general manager, Indianapolis, Ind., 22 stations; Grand Rapids, Newaygo and Lake Shore Railroad, C. Warren, superintendent, Grand Rapids, Mich., 8 stations; Chesapeake and Ohio Railroad, W. C. Wickham, second vice-president, Richmond, Va., 25 stations; Rome, Watertown and Ogdensburg Railroad, F. A. Van Horn, superintendent, Oswego, N. Y., 17 stations; Greenville and Columbia Railroad, R. H. Temple, superintendent, Columbia, S. C., 12 stations; Chicago, Milwaukee and Saint Paul Railroad, B. L. Lennox, general superintendent, Milwaukee, Wis., 358 stations; Chicago and West Michigan Railroad, A. Nichols, general superintendent, Grand Rapids, Mich., 41 stations; New York and Oswego Midland (now New York, Ontario and Western Railroad), Theo. Houston, general manager, New York City, N. Y., 49 stations; Memphis and Little Rock Railroad, W. E. Smith, superintendent, Memphis, Tenn., 13 stations; Grand Trunk Railroad, J. Stevenson, assistant superintendent, Island Pond, Vt., 14 stations; Flint and Pere Marquette Railroad, H. C. Potter, receiver, East Saginaw, Mich., 9 stations. Total, 2,889 stations. This office furnishes the blank bulletins, the frames for displaying them, and the necessary forms, envelopes, and stamps for making regular reports of the receipt and display of the bulletins.

The river reports, giving the average depth of water in the different great rivers of the interior, and notices of the dangerous rises for the benefit of the river commerce and the populations in the river valleys, have been regularly made, telegraphed, bulletined in frames, and also published by the press at the different river ports and cities. River stations have been opened on the principal California rivers.

The manner in which these reports are prepared and used, and the mode by which a "danger-line," with water below which there is considered to be no danger, while every rise above it is dangerous, have been sufficiently explained in preceding annual reports.

The uses of the information published in reference to this danger-line had in connection with the daily reports of this office have, on the occurrence of river floods, enabled those interested to judge of the probable limits of the rises of the water to be expected at the different places on the river-banks, and of the dangers to be anticipated. This knowledge has made possible many and necessary precautions for safety.

The data had at this office from stations making river reports permit a foreknowledge of changes likely to happen, and make it possible to give useful warnings of coming floods, ice floods, or of sudden and great rises of the river water-levels. The daily reports are useful also at times of low water, the information they then give permitting river shipping to be moved with intelligent foreknowledge of the probable depths of water to be found in the river channels at different points upon the river's course. These reports are especially useful to those for whom they are intended, as having an official character.

In instances which have attracted the attention of this office, the notices of the probable heights floods anticipated or then passing would attain, have been followed by preparations made to guard against danger.

A brief examination of the charts of changes of the river-levels accompanying this and preceding reports shows that the river rises to occur at the different localities can be judged of frequently as to the time at which they will occur, and their extent by the conditions existing at points sometimes far distant. Accumulating data render studies of this kind valuable. In connection with these studies the examination of the daily weather-charts, showing places at which precipitation has occurred or is likely to occur, and the amount of such precipitation, had with the study of the charts of the river basins, which enable it to be determined what rivers will be affected by precipitation, are found to be of value in furnishing correct prognostications. This subject has been referred to in preceding reports.

The Chief Signal Officer has before expressed the opinion that with proper study of the river floods, and with stations properly placed, reporting at times of especial danger, it can be made almost impossible for a flood to follow a river course without notice given in advance of its coming at the localities threatened.

Daily bulletins of river reports have been regularly displayed during the year at the following-named stations: Augusta, Ga.; Cairo, Ill.; Chattanooga, Tenn.; Cincinnati, Ohio; Davenport, Iowa; Dubuque, Iowa; Keokuk, Iowa; La Crosse, Wis.; Leavenworth, Kans.; Little Rock, Ark.; Louisville, Ky.; Memphis, Tenn.; Morgantown, W. Va.; Nashville, Tenn.; New Orleans, La.; Omaha, Nebr.; Pittsburgh, Pa.; Portland, Oreg.; Red Bluff, Cal.; from December 15, 1879, to March 15, 1880: Shreveport, La.; Saint Louis, Mo.; Saint Paul, Minn.; Umatilla, Oreg.; Vicksburg, Miss., and Yankton, Dak.

Systematic reports of river observations, carefully made and closely studied, are had daily by telegraph and weekly by mail, on established forms, from the stations above named. Reports of similar observations, made daily, are also had from special river stations, named elsewhere in this report. These observers constitute a river guard. For the months in which floods more frequently happen, and at any time in any case of especial danger, the reports are telegraphed. For those months of the year in which danger is not anticipated from floods, these reports are forwarded by mail.

Charts of the changes in the principal Western rivers for the year ending June 30, 1880, and upon which stations reporting to this office have been established, are given in charts 10 to 21.

It will be noted that by the study of such charts, continued from year to year, those seasons in which floods are more likely to occur on any water-course can be predetermined, and it can be ascertained what amounts of precipitation, occurring in the different river-basins, and under what circumstances, will be followed by floods, and, approximately, what will be the extent of floods shown in this way to be anticipated. Whenever the facilities of the Signal Service are so far extended as to permit systematic observations to be had of any river-course and telegraphic warnings to be given in instances of danger, the serious loss of property or life caused by floods can be, and with comparative little expense, guarded against on any river throughout the United States. The occasions occur on the separate streams at long intervals only. The levee systems of the Mississippi and other great rivers can be in no way better guarded themselves, and made in their turn safeguards to the immense agricultural interests they are intended to protect, than by systems of river reports, which will warn of danger in time, and summon, if need be, the strength of the State to watch and strengthen these State constructions.

The system of river reports is now extended to the rivers of California and Oregon, as well as to the principal rivers east of the Rocky Mountains.

Arrangements are now being perfected for the construction of river gauges at Brownsville, Rio Grande, Edinburg, and Laredo, Texas, when daily reports of the stage of water in the Rio Grande River will be transmitted, by telegraph, to the former place and bulletined for the benefit of the public.

Table showing the location of the special river stations east of the Rocky Mountains reporting to the Chief Signal Officer, the names of the observers, the date at which each began reporting originally, and the highest and lowest water at each, during the year ending June 30, 1880.

* Water below bench-mark.

Observations are taken at these stations during the rainy season, and when the water approaches the danger line reports of the depth of the same are telegraphed daily to certain designated stations on the lower waters of the rivers on which they are located, and continued until danger to property along the banks is passed. Mail reports are also forwarded weekly to this office.

The daily reports of the surface and bottom water temperatures, at designated points upon the lakes and sea-coasts, have been continued throughout the year, and copies of them furnished, as in preceding years. These reports are furnished at the request of Prof. Spencer F. Baird, United States Commissioner of Fish and Fisheries, the object had in view being to determine the proper waters in which to place the different varieties of food-fishes.

It is necessary for this purpose to ascertain the extremes and means for the year of the water temperatures in the different localities. This series of reports has now continued for seven years. Statistics of this kind—the depth of the water in the different streams being, as it is, daily noted—form the basis of a systematic study of pisciculture, in which are considered, by students attached to the commission, both the amount of the water supplies in different channels or basins at the different seasons of the year, and the temperatures to be expected in each. There is no more ready way for furnishing cheap food for the people than by the culture of food-fishes, and every facility for the work within the control of this office is gladly furnished to this end. It is quite possible that the great fisheries on or near the Atlantic coasts, or on the fishing banks, could be materially aided by the preannouncement of the barometric or other atmospheric changes approaching, were the office informed of the precise nature of the reports to be desired. It is anticipated that under the laws providing for the sea-coast service of the Signal Service, it will, in the near future, be possible to furnish officially series of reports suitable for this purpose from observations taken at points on and near the coast at stations contemplated in existing laws.

The series of reports, being the announcement from day to day of such approaching changes of temperature as would be likely to cause the closing of canals by freezing, or, as in other cases, would open them, were continued during the days of closing canal navigation of the fall and winter of the past year. This series of reports has now been continued for eight years. The commerce moving upon the canals of the United States, as the closing of the canals draws near, is sometimes of greater value than at any other portion of the season. These water-routes are then thronged with hundreds of laden barges, each of which must move with reference to the danger of the closing of the routes by freezing. The market rates at the great cities are influenced by the probabilities that the merchandise or grain thus afloat will reach or fail to reach the points for which it is intended. These reports are received with satisfaction by the canal companies, and by the commercial associations of cities. They constitute, for the months of November, December and January, one of the regular issues of the office.

The exhibition of symbol maps, on which the meteoric conditions are shown by symbols, changing for each report, at the rooms of boards of trade, chambers of commerce, and of commercial associations in the principal cities, and at places of public resort, for the benefit of shipping and other interests; the display of bulletins, the distribution of weather maps, and the employment of other methods for rapidly diffusing, for public use, the information had at this office, have been continued for the year ending June 30, 1880. The purpose had in view by this regular distribution has been to induce an effort on the part of those examining the different charts and papers to foretell to some extent the changing weather for themselves. The official reports of the office relate to districts, at special localities, in which districts the local indications may point to modified conditions. These local studies are also useful in many ways which space here would fail to describe. The expectation of the office has been well realized in this regard, and in many places there are among the citizens and business men careful students of the data daily symbolized, who use their own judgment to determine to what extent the conditions announced for the district will prevail at the places in which they may be, or consider approaching changes foreshadowed by the symbols upon the chart, but which are yet too remote to be announced as indicated. Investigations of this character ought to be encouraged.

The instruments prepared for local use (the Weather Case), and before referred to, will greatly aid such studies.

For a number of years past the attention of the office has been given to the subject of the preparation of a weather chart of such character as to appear printed in the newspaper journals throughout the United States. Charts of this character have been much sought for as aiding such studies as those just described above. The popular demand has been pressing. The office has fully appreciated the propriety of the demand and the value of the results to be had from the study of such charts could they be made to appear simultaneously in the different cities.

The work has been surrounded with unusual difficulties. The preparation of newspaper weather charts is not difficult, and such charts have long since appeared in some of the prominent European cities. The journals in which these charts have appeared have been located, however, in the city in which was the office at which the meteorological charts had been prepared. It was not of record that a weather chart, prepared at any central office in Europe or the United States, had been so arranged for that it could be telegraphed in such form as to appear in the lines of its charting simultaneously in the journals of different cities, each city widely separated from the others, and this telegraphing and printing so rapidly done that the map might accompany the printing at any city of the data for the day, from the study of which data the map itself had been charted at the central office in some other city. The duties of this office are of such a nature that all of the chart-telegraphing must be based upon plans which will enable all of the conditions thus stated to be filled. An attempt to transmit journal charts of this description to answer such a purpose was made at the time of the Centennial Exhibition of the United States, when a daily weather chart to accompany the daily weather report issued daily at that Exhibition was telegraphed each morning from the office of the Chief Signal Officer at Washington to the station of the Signal Service exhibit in the Government Building at the Exhibition at Philadelphia, and appeared each day as the official weather chart issued in separate copies at the Exhibition and also in the columns of a daily journal there printed for daily issue.

These charts were transmitted by process of autographic telegraphy which could not be effected at great distances. They required special instruments. Within a year past the studies and experiments conducted at this office and having relation to this subject have resulted in such plans that it is now found not difficult to transmit to any city which can be reached by telegraph, and without the use of special telegraphic instruments, such data as will permit the charts prepared in the office to be exhibited in any city or cities to which the data are sent, in chartings precisely similar, of any size, and to appear printed in the columns of the daily journals at the same time that the forecasts had at this office, from the study of the original chart, appear printed in the same journal.

The difficulty no longer exists as to the telegraphic transmission of the chart. On May 9, 1879, the issue, daily, of a chart so transmitted by telegraph, from Washington, was commenced in the Daily Graphic, a journal printed in New York, and this issue has been continued daily, except Sundays. The processes are not yet considered perfect. It is hoped to obtain more satisfactory results.

It is not necessary to dilate here upon the advantages to result from the power of transmitting to any number of places and to any distance at which telegraphing is possible, with the rapidity of a telegraphic dispatch, copies of the charting of the weather conditions over any extent of the earth's surface, the copies exactly similar and made at any central office at which the proper data have been concentrated.

The forms of the bulletins heretofore referred to as those published daily for the use of farmers, of the special bulletins issued for the use of seamen, for the river reports, for the canal reports, for railway bulletins, and for the varied interests which the information borne upon the bulletins is intended to benefit, change gradually with increasing knowledge and facilities. Each form has its object. The number of bulletins issued at each station is closely scrutinized and is reduced to the smallest number which can be wisely used.

The publication of the Monthly Weather Review and of the Weekly Weather Chronicle has been continued during the year. The monthly issues of the Review are given in the appendix (Papers 33 to 44).

The scope of the Monthly Review has become coextensive with the number of reports received both by telegraph and mail, all of which are valuable for reference, and a study of which enters necessarily into the study for the preparation of each Review. The collection of material for this paper permits also the study of especial storms, descriptions of or facts relating to which are given in the local journals of the region over which they pass, or in the shipping news communicated by vessels encountering them at sea. The charts which accompany each issue of the Review exhibit the uses made of meteorological data. Each of these charts is to some extent the reduction of data first chronicled on two hundred and forty study-charts for the month. It will be readily understood how much this monthly reduction simplifies the work of generalization for the year. The Review exemplifies, also, to some extent, the consideration of the great mass of data before mentioned as entering upon the files at this office. Each issue of the Review contains, under the head of "Notes and Extracts," a brief summary of meteorological intelligence, compiled from the publications received at this office, and by which the marked advances in meteorological science are readily brought to the notice of the numerous correspondents cooperating with the service. The section added in 1877, under the heading of "International Meteorology," has been continued during the year just passed. Additional charts, embracing the northern hemisphere, now accompany the Review and will be found referred to and described in the text of the Reviews under this heading. The wide circulation given this Review meets, in part, the popular wish expressed, here and in foreign countries, for generalization prepared at this office, while the receipt of a copy of the Review by each one of the hundreds of the voluntary observers, now its correspondents, at points extending in their range around the earth, is accepted by them as at once a sufficient acknowledgment of, and compensation for, the labor of making their daily reports.

It is an advantage of the chart issues of the Review that they are continued from month to month, and thus enable the meteoric conditions existing upon the earth's surface to be studied continuously and in a regular sequence.

The preparation of the matter for the publication of the "Synopses, Indications, and Facts," commenced in 1872, has been continued. Thirty-five volumes of the bound Daily Bulletins, with accompanying charts, had been issued up to June 30, 1880, and other volumes are expected to follow as rapidly as they can be obtained from the printer.

As described in preceding annual reports, these volumes, issued in sequence, one for each month, contain the records of all the tri-daily telegraphic reports received at the office from the dates at which such records commenced; the tri-daily charts, upon the study of which each report was on that day issued, together with a statement of "facts" or meteoric conditions which subsequent reports have shown as actually existing during the time and in the district for which each forecast was made. The maps afford a meteorological record as compact as ought to be desired for especial researches or for generalization to be based upon continued series of meteorological observations. The volumes themselves are useful for purposes of exchange, and bring to the office publications sent in return exchange fully equaling their value. They constitute a meteoric record more full, perhaps, than any other now issued.

It was estimated in the last annual report that by the publications of this office, which have been above referred to; by the cautionary signals displayed by day or at night on coasts or at ports in times of probable danger; by the announcement of probable changes of weather in the Synopses and Indications furnished thrice daily to the press; the Farmer's Bulletin, exhibited at so many villages and hamlets in the interior; the river and canal reports made with reference to river and canal interests; the bulletins and data exhibited at all the great cities and ports; the symbol maps displayed in boards of trade rooms and rooms of chambers of commerce; the Weekly Chronicle and Monthly Weather Review furnished to agricultural societies, commercial associations, and correspondents of the office; the daily weather maps; the monthly charts; and, finally, the charts condensing the results of years of observation, the information emanating from this office was received in some form daily at no less than one-third of all the households of the United States.

To this wide diffusion there has been added, since the date of that report, the increased circulation had by the two thousand eight hundred and eighty-nine railway bulletin stations heretofore referred to.

As hitherto related in this report, while treating of the subject of international meteorology, the work of the office reaches later, by its publications, nearly every prominent establishment in the world. It is considered that it contributes to the world's work published material valuable now, to be more so in the future, and sufficient of itself to compensate for the whole cost of this service from its commencement.

The different reports of the office, of which mention has thus been made, continue to be favorably received in the communities for which they have been furnished. Their uses are acknowledged by commercial associations and other official bodies.

The regular daily publication of the reports of forecasts by the press, now continued for nine years without cost to the United States, is considered as an evidence of their usefulness and of the favor with which they are received by the communities for which they are intended.

The office continues to be in correspondence, in reference to its duties, with committees appointed for the purpose by the boards of trade and chambers of commerce of the principal cities in the Union, and also with a large number of agricultural societies.

Permanent committees, appointed by boards of trade, chambers of commerce, &c., have been in co-operation with this office since 1877. These committees inspect, in compliance with the request of the Chief Signal Officer, the local offices of the service at the places in which the committees may be appointed, and report monthly to this office upon the condition and utility of the service in their vicinities. The boards in this way at once co-operate with this office and share the responsibility for its success.

The resolution upon which these committees were established, as adopted by a number of the prominent associations of the United States, is as follows:

> *Resolved,* That the meteorological committee of the board of trade (or chamber of commerce) shall be a permanent committee, and that the names of the members, and any changes in membership, be, in each case, formally notified to the Chief Signal Officer of the Army. The committee will confer with the Chief Signal Officer and will bring before the board (or chamber) all matters requiring its action, as relating to, or needed for, the improvement of the Signal Service.

The organizations which have adopted this resolution are enumerated in Paper 45. There are rules for the government of these committees, together with the form of reports they are desired to furnish monthly.

The appointment of these committees affords at once a board of reference, to which questions of local interest may be referred for their views, and provides an authorized source from which this office may learn of its successes or failures, and be thus enabled to direct its efforts in the several localities. It furnishes also a local supervision by parties interested themselves through their personal interests in the successful discharge of the duties of the service, and who will strive, for this reason, to best advise how that success may be attained.

The services of these committees have been found to render important aid to the work of the office. The supervision had by them is very necessary, and has had a good effect. Their duties involve a responsibility which has been appreciated by the members of the committee.

A list of disasters upon the lakes, comprising those only which have resulted from stress of weather, during the year ending June 30, 1880, compiled by Sergeant William Finn, Signal Corps, U. S. A., in charge of the Milwaukee station, is given in Paper 46.

Paper 47 contains the names of places from which requests have been received for the establishment of signal stations, but at which stations had not been established June 30, 1880.

The total solar eclipse that occurred on the 29th of July, 1878, was made the occasion of numerous interesting observations throughout the United States by the officers and enlisted men and the co-operating voluntary observers of the Signal Service.

A full account of these observations, together with some of the results to be deduced therefrom, will be found in the accompanying report by Cleveland Abbe, assistant. (Paper 48.)

It appears from this report that the data accumulated in the archives of the Signal Office were made useful by the preparation in advance of a table showing the probable character of the weather to be expected that day, by means of which observers were enabled to select stations having prospects of clear or fair weather.

Most extensive preparations were made at many Signal Service stations. Among which may be specially mentioned Pike's Peak, Colorado Springs, Virginia City, Key West, Havana. The expedition to the summit of Pike's Peak was under the personal supervision of the late Chief Signal Officer and his assistant, Professor Abbe.

In all there were received reports from 300 stations or localities, 100 of which are published in full in this general report.

It is believed that special interest and value attaches to the observations and suggestions made in connection with the subject of the extension of the solar corona, its connection with streams of meteors, the reliability of Regnault's psychrometric formula, the total amount of light received from the solar corona, the fall of temperature during totality, the official phenomena attending totality, and the position of the shadow band or belt of total obscuration as defined by observations of duration of eclipse.

A collection of 29 engravings accompanies the report, giving, thus, a graphic representation of the appearance of the corona to observers scattered all along the belt of totality from Idaho to Cuba, and all which combine to demonstrate that the corona in all its main features remained unchanged during the hours occupied by the shadow in traversing this distance.

Professor Abbe has given a very full collection of references to the sources of our knowledge of the latitudes and longitudes of the stations occupied by the eclipse observers, to which those desiring to pursue further investigations will probably have frequent occasion to refer. He has also added a brief study of the theory of the August psychrometer, whence he infers that if the Signal Service is to continue the use of this instrument there should be at once instituted a satisfactory comparison, at high and low and at very dry stations, with the Dew-point apparatus of Regnault, Dives, &c. Incidentally to this he gives the result of a comparison of thermometers, which enforces the importance of adopting in the Signal Service work the latest requirements in thermometry.

Especial thanks are due to the voluntary observers Prof. F. H. Loud, C. G. Boerner, and to the sergeants of the Signal Service J. A. Barwick, Wm. Black, Rufus Choate, E. McGovern, M. J. Shanefelter and the Signal Service Observer Chas. Hasselbrink, for the ability and energy shown by them in the execution of the work undertaken.

To the hearty co-operation of the Engineer Bureau, the Quartermaster's and Surgeon-General's Offices, the officers of the U. S. Geological and Geographical Survey, of the Coast Survey, and of the telegraph and railroad companies the office is also much indebted.

By direction of the Chief Signal Officer, Private John P. Finley, Signal Corps, U. S. A., investigated and prepared a report upon the remarkable tornadoes of May 29 and 30, 1879, occurring in the States of Kansas, Missouri, Nebraska and Iowa. The storms, thirteen in number, most of which passed through Central Kansas and Western Missouri, developed unusual violence and the characteristic peculiarities of this class of atmospheric disturbances. In no instance was there an exception reported to the usual direction of translation of the storm-cloud, viz: from southwest to northeast; and with equal invariability the movement of the whirling air within the cloud vortex was, according to all the statements collected from eye-witnesses, from right to left, or contrary to the direction of the hands of a watch. (Paper 49.)

By means of charts, both topographical and meteorological, and a large number of carefully-prepared sketches accompanying the text, a faithful effort has been made to present an exhaustive consideration of all of the available data.

Particular attention has been given to a most important feature in the study of this class of storms, viz: the reference of every object acted upon by the wind to its relative position regarding the supposed center of the storm-track. This treatment gives at once the most available factors in determining the various actions of the storm-cloud, its peculiar form at different points in the storm-track, and an opportunity to investigate intelligently any irregularities or departures from the usual mode of action. A collection of data and its proper disposition with a view to elucidate the mooted question of the tornado's origin has been attempted with much earnestness, and it is hoped with equal success. The independent character of these storms which distinguishes their rightful claim as a distinct class of atmospheric phenomena, strictly termed tornadoes, is attested by a strong chain of evidence. This point is more elaborately considered under the head of a general essay on tornadoes accompanying the report, covering a field of investigation which includes the most important storms of this class examined in previous years under the direction of the Chief Signal Officer, and embodied in his annual report. In connection therewith, and having the same end in view, a series of tables were prepared combining a collection of some three hundred tornadoes, reaching back as far as 1794, and arranged under a classification of some fifteen general characteristics, showing very graphically their marked individuality.

Twelve charts have been prepared by First Lieut. A. W. Greely, acting signal officer, which shows by isothermal lines for each five degrees the mean temperature of the United States from 1871–1880, for each month of the year. They are drawn on the same scale, and are intended for reference and comparison with the monthly charts of temperature which are regularly issued from this office with the "Monthly Weather Review."

On these maps is graphically represented the following data:

1st. Monthly mean temperatures at the Signal Service stations from July 1, 1871 (or from the various dates of establishment of the later stations), to October 1, 1880.

2d. Monthly mean temperatures given in the reports of the Army post surgeons from July 1, 1874, to October 1, 1880.

3d. Monthly mean temperatures observed and reported by voluntary observers of the Signal Service from January 1, 1874, to October 1, 1880. These reports are sufficiently numerous to render possible such charting as shows with considerable accuracy the mean monthly thermal conditions of the country east of the 97° meridian for the past nine years, and to the westward for the past six years. No means, Signal Service or voluntary, have been used which do not cover at least three consecutive years, and but very few of less than six years' duration. The means relating to regular Signal Service stations are generally one-fourth the sum of the 7 a. m., 2 p. m., and twice the 9 p. m. (local mean time) observed temperatures.

At certain telegraphic stations of the Signal Service in Arizona, Dakota, New Mexico and Texas, where only simultaneous observations at 7.35 a. m., 4.35 p. m., and 11 p. m. (Washington mean time), have been made, one-third of their sums have been used as a mean; such means will be found to differ but slightly from the true means.

The means reported by the Army post surgeons are one-third of the sums of the observed temperatures at 7 a. m., 2 p. m., and 9 p. m. (local mean time), as also are the greater part of those reported by voluntary observers. For the purpose had in view, it was deemed best not to correct for want of uniformity in methods of deducing daily means. The discrepancies, resulting from dissimilar methods of obtaining such means, are evidently less important than those arising from systematic errors of observers, from the use of unreliable instruments, which have not been compared with an accepted standard, and above all are from the widely different methods of exposing thermometers. To insure accuracy, the Signal Service means on which these charts are based have been carefully compared and checked, and in doubtful cases the monthly mean has been computed anew from the original observations.

In determining the direction of the isotherms the greatest, indeed predominating, weight has been given to the Signal Service means.

The isotherms, where crossing mountain ranges, express the temperature not of the peaks or elevated and isolated stations, but of adjacent valleys.

The method has been adopted of connecting mean temperatures of equal value in contiguous valleys or plateaus by a nearly direct route, giving the lines only such curves and directions as have been suggested by the data collected.

It is evident that the isotherms of the tops of mountain ranges vary most materially from those of the valleys at their bases, and that the outlines of isotherms on such mountains depend very largely on the contour of the ranges at any given elevation.

Even were it desirable to draw lines based on elevation and the very scanty data available from elevated stations, the size of these charts would have precluded it. These charts are not for insertion in this report, but may be had on application to this office.

Lieut. A. W. Greely, acting signal officer, has prepared a list of auroras for insertion in this annual report. (Paper 50.) The list comprises all auroras (in North America) reported to this office by Signal Service and voluntary observers, from August 1, 1873, to December 31, 1875. The arrangement is chronological and geographical. The places at which the aurora has been observed have been entered alphabetically under the name of the State or political division in which these places are situated. Following the name of the place is given, when practicable, the hour of commencement and ending of the display. In cases where the time was given by the observer as evening or morning, "p. m." and "a. m." are respectively used. Where no time is given the observer has simply reported that an aurora occurred on that date.

Wherever a. m. occurs it refers to time preceding sunrise of the date given; p. m., in like manner, refers to time after sunset on the day named. Without it is otherwise specified, mean local time is given.

Many of the auroras for which no time is given were probably observed at 9 p. m., local time, that being the only hour of darkness at which volunteer observations are regularly made by the voluntary observers of the Signal Service.

In cases where it is very doubtful if the phenomena were auroras an interrogation point has been inserted. Such marks have been sparingly used.

Where the observer has reported a display as continuing at his last observation, where its obscuration has occurred while yet bright, where the hour of commencement but not of ending has been reported (and *vice versa*), in such cases there have been respectively used "till after," "obscured," "from," and "till."

Lieutenant Greely has also prepared an index to the appendices of the Annual Reports of the Chief Signal Officer of the Army from 1870 to 1879, inclusive. Charts and maps are given their running numbers. (Paper 51.)

In the instrument-room of the office one thousand four hundred and fifty-eight meteorological instruments have been carefully compared with the official standards during the year ending June 30, 1880, and one thousand one hundred and sixty-seven have been issued during the same period. Experiments with different forms of self-registering apparatus have been continued systematically with the view of securing forms adapted to general use on station.

Seven hundred and eighty-eight meteorological instruments have been purchased for station use and seven hundred and fifty-seven have been issued during the year ending June 30, 1880.

The artisan work in the instrument-room and repair-shop of the office continues to increase steadily in amount with the increased distribution of instruments and the number of stations.

The practice of sending instruments by mail, in the charge of postal agents, under the special arrangement for this purpose made with the Postmaster-General, continues to be of material benefit to this office. The superintendent of the railway mail service and his assistants of the Post-Office Department have rendered careful and energetic aid in this work of transportation. Such aid is important to a service which reaches into every portion of the United States.

A considerable number of instruments, anemometers, hygrometers, water-thermometers, rain-gauges, &c., have been issued to the Chief of the Bureau of Navigation of the Navy Department for use on vessels of the United States Navy in making, in co-operation with this office, the naval series of simultaneous observations directed by the honorable Secretary of the Navy in General Order No. 220, dated December 25, 1876. This office supplies, upon proper application and receipt, any instruments required for this purpose. Reports of naval observations transmitted to this office are entered on the International Bulletin and are charted upon the International Weather Charts.

A number of instruments have been furnished for temporary use on vessels of the commercial marine engaged in similar co-operation upon the marine series of observations.

The regular weather reports have been received during the year over the wires of the Western Union, Northwestern, International Ocean, and American Union Telegraph Companies. Seven hundred and forty-eight thousand three hundred and eighty-four cipher words of weather reports have been received at, and thirty-six thousand six hundred sent from this office during the year ending June 30, 1880. Eighteen thousand five hundred and sixty telegraphic messages (exclusive of those sent and received by the sea-coast line), other than weather reports, were received, and thirteen thousand five hundred and seventy sent in the same period. There were also received during the same period seven thousand and seventy-six cipher words of special river reports.

The plans of working forms of telegraphic circuits, and the rapidity of telegraphic work by them assured to the service, have been sufficiently referred to in preceding reports. They have given satisfactory results throughout the year past.

The average time elapsing from the time at which the reading of the instruments have been had at the two hundred and forty-seven separate stations scattered throughout the United States and Territories to that at which the reports based on these readings have been telegraphed to the press and to the distributing stations has been one hour and forty minutes.

It has been mentioned in preceding reports, but it is proper to again call attention to the fact, as one of the consequences resulting from the organization of this office, that, by the use of ciphers, improved with the experience of years, the facility with which constant practice has rendered practicable the telegraphic work necessary for the reports, and the understandings arrived at with telegraphic companies, the annual cost of the telegraphic communications of the office has been reduced by many thousand dollars. As an actual annual saving, this must be considered as a saving to the Treasury of the United States of an equal number of thousands of dollars. In the early days of the duty the telegraphic companies overestimated the labor required for the service, and the difficulties to be encountered by them in discharging it with the regularity and the vigor demanded. With the long experience of years the difficulties of this nature have vanished.

With the plans now for ten years tested on this continent there has been found no difficulty in collecting with sufficient rapidity meteorological data had over the widest extent of this continent's surface, and reaching from the Atlantic to the Pacific Ocean.

The application of similar plans for the telegraphic collection of data for any similar purpose whenever undertaken by any government or combination of governments upon the distant continents, as those of Europe, Asia, or Africa, cannot fail to be attended with similar results.

The relations of the office with the telegraphic companies are now cordial everywhere. It has come to be recognized that when this office insists upon work at very economical rates, and sometimes upon unusual telegraphic facilities, it is compelled to do so by the plainest dictates of duty.

The duties of this office, as charged with the supervision of the telegraphic duties of the War Department, and especially responsible, when need be, for the prompt transmission and proper care of the messages of the President and Secretary of War, and other superior authorities, together with the recognized position of the Chief Signal Officer, as the agent of the Secretary of War, in the control and management of the interior lines now constructed and worked upon the frontier, and connecting as well military posts and stations as the villages and hamlets of the advancing frontier populations, devolve upon the office many cares and the settlement of many and novel questions involving the relations of the United States and the different telegraph companies. In all these matters, the assistance and advice formerly given the office by the distinguished lawyers, then acting as special assistants to the Attorney-General, the Hon. William Whiting, at one time Solicitor of the War Department, and the Hon. Reverdy Johnson, formerly Attorney-General of the United States, both then acting as special assistants to the Attorney-General, have proven of the greatest advantage.

Few questions have arisen, or are likely to arise, which will fail to find their settlement in the lucid opinions and wise instructions prepared by these gentlemen.

With the increasing population of the country, the unusual progress of civilization in the interior west of the Mississippi, the multiplicity of the public business, and the habitually greater use of telegraphy in public affairs, render it more important that the dispatches of the superior civil and military authorities should certainly reach the persons to whom they are addressed, and be securely protected from inspection by improper persons. The gravest affairs may be complicated by the delay or the improper revelation of official telegraphic dispatches. The care of the office is always given to this protection when informed that it is desired.

The relations of the office with the different telegraphic companies enable it to secure, in time of need, a rapidity and a certainty of transmission of particular dispatches, which may especially need such action, perhaps not to be had by any other agency. The experience already had in the management of frontier lines, under the novel circumstances in which those existing upon the frontier have been placed, has afforded such suggestions as to plans of working them as to warrant the belief that, as facilities permit, they will compare favorably in the rapidity of their work with those existing wholly within the limits of civilized and settled regions.

The increasing use of the United States lines for commercial purposes, as they extend into the interior and upon the frontiers, into regions the development of which they greatly advance, place upon the wires many important messages entitled, as is matter passing through the mails of the United States, to official protection.

The sea-coast service of the Signal Service, in connection with the Life-Saving Service, has been referred to and described in preceding reports. The total length of the sea-coast lines constructed by this office is now six hundred and ten miles. There is left for this report little more than rehearsal. The coast lines are connected with this office by leased wires from Cape May, Lewes and Norfolk. The telegraphic lines, reaching from Sandy Hook to Cape May, from Cape Henlopen to Chincoteague, and from Norfolk by the way of Cape Hatteras to Wilmington and the mouth of Cape Fear River, on the most frequented and in some places the most dangerous coasts of the United States, have been continued in operation. The stations upon these lines are occupied and the telegraphic lines are operated by enlisted men of the Signal Corps. (Map 22.)

During the year a telegraph line was constructed by enlisted men of the Signal Corps, under the immediate supervision of First Lieut. W. E. Berkhimer, acting signal officer, from the Delaware Breakwater, Del., to Chincoteague, Va. The line, 60 miles in length, was commenced October 18, 1879, and completed November 9, 1879. The poles are iron, placed 25 to the mile, and far enough back from the surf line to be secure from storms and at the same time easy of access in cases of vessels coming ashore. The construction of this line has practically proven the value of iron over wooden poles for sea-coast telegraph lines. From the date of its completion, November 9, 1879, to June 30, 1880, not a single pole was misplaced, nor a break in the wire. Virtually speaking, the line has worked 8 months without interruption.

The establishment of a full signal station on the Delaware Breakwater has proven its value to the commerce of Philadelphia and for vessels making that a harbor. Cautionary signals are displayed from a flagstaff on the Breakwater, where they can be readily observed both day and night by passing vessels and those in the harbor. All vessels passing the station are reported by telegraph to Philadelphia and to the Chief Signal Officer as soon as sighted, and copies of the telegrams furnished to the different shipping exchanges at once by messenger, and to the public through the columns of the daily press.

The act of Congress requiring this service contemplates the establishment of signal stations at life-saving stations and light-houses at points along the coast in such manner that the coast and sea in their vicinity may be at once kept under observation, warning of approaching storms be given to vessels within signal distance, and information of disasters and other incidents occurring be rapidly conveyed to the chain of life-saving stations, to light-houses, ports from which aid may come in case of need, and to this office.

These lines and stations are on the sea-coast itself, and in positions whence they command a view of the sea, and where they can have knowledge of disasters to occur from shipwreck. The reports of the weather conditions and of the state of the sea had by them, and not attainable in any other way, are necessary. Vessels passing in view can be at once warned by signals of coming danger, or be communicated with by signals, and can be aided if in distress. The telegraphic wires connect each station with the War Department.

It is an advantage of telegraphic lines thus managed and worked by the force of the Signal Corps that the breaking of the wires at inlets or in violent gales need not break the communication along the coast. In cases occurring during past years, messages have been transmitted for weeks together over extensive breaks of wire lines reaching past inlets by means of the usual day and night signals with flags and torches. Similar methods may be used in the instances of broken lines in the interior.

The enlisted men at these stations are taught to take and report meteorological observations, and, as signal-men, are practiced in both the Army and Navy codes, in the usual semaphores, and in codes of permanent flag signals, to enable them to communicate with vessels of any nationality. The service has proven its usefulness in the cases of disasters to shipping and for the meteorological purposes for which it was established. It has been firmly established by its utility.

The sea-coast service stations in operation are located at Sandy Hook, Barnegat, Little Egg Harbor, Atlantic City and Cape May, N. J.; Norfolk and Cape Henry, Va.; Station No. 5, Kittyhawk, Cape Hatteras, Portsmouth, Cape Lookout, Fort Macon, New River Inlet, Sloop Point, Wilmington and Smithville, N. C.; Delaware Breakwater, Del.; Ocean City, Md.; and Chincoteague, Va.

The constant changes occurring in the width of the numerous inlets, across which the line upon the coast is carried by cables between Cape Hatteras and Wilmington, the character of the outer beach, the only land upon which the lines could be placed, the destruction of portions of the lines and changes in the coast itself, caused by storms, have continued to make the maintenance and operation of the line south of Cape Henry a work of difficulty.

It is not necessary to explain at length the importance of a service of this character on our sea-coasts. The reasons for its maintenance and the benefits to be expected from it are manifest. The commerce which approaches a coast on which a thorough sea-coast service exists is spared disasters, in comparison with the cost of which the cost of the service is little.

The watch kept by the service and the prompt transmission of a few messages have, in time of danger, saved life and property.

It has been a source of complaint among the seafaring men on all those coasts on which storm-signals have been attempted to be displayed that, while it might be learned by vessels lying in port and from the display of such signals, with reasonable certainty, whether or not a storm was so impending as to render it unsafe to risk exposure at sea, there was no plan of storm-signals devised or devisable by which it could be communicated to vessels themselves actually at sea, and in sight of the stations, beyond the mere fact that a storm was threatening, and from what direction it was to be expected. It was not possible to advise on what coasts it would be dangerous; whether or not any particular voyage might be continued in safety, or when and where shelter ought to be sought. The fortunate connection had by this office by means of telegraphic lines with all its sea-coast stations has lessened these difficulties.

On February 4, 1878, an order was issued by which are announced the stations of the service prepared to hold communication by the international code of flag-signals with vessels of any nation at sea coming within the proper signal distance. It is so arranged that any question as to weather changes anticipated so signaled from the vessel to the shore-station is immediately transmitted by telegraph to the central office, whence prompt reply is ordered.

This reply, on reaching the coast stations, is signaled by flags, if need be, to the inquiring vessel. It is possible thus to gain any needed information without landing a boat. It does not appear how a system of storm-warning or coast-signaling can be given a greater scope than is arrived at by this process. The instance may be imagined, for illustration, of a vessel sailing from New York for a southern port and making inquiries off the Capes of the Delaware whether it will be safe to pass Cape Hatteras, and advised from this office in reply to the inquiry transmitted to this office that a storm at the time is moving near Hatteras, and to take shelter at the Delaware Breakwater until the disturbance shall have passed northward. In the occurrences of each year there have been instances in which steamers moving along the coast have conducted their voyages from port to port upon the answers to special inquiries addressed from the ports in which they might be to the office. There have been instances in which such special inquiries have been signaled from the vessel to the station, telegraphed thence to the office, and the telegraphic answer signaled again to the vessel. With proper appliances such plans of communication might be established along the extent of the coasts of the United States.

In the last annual report several disasters were described as occurring upon the Atlantic coast, and the action of those of the Signal Corps occupying the stations upon the coast, was related at some length to illustrate by the different incidents the character of the especial service it was expected to render. Since the date of that report several severe storms have swept the same coasts. It is since that report, that the systems of display-stations established by this office has rendered it possible to exhibit warning signals at almost every navigable inlet. There have been no disasters of magnitude to record. The hope may be indulged that this decrease in the number of disasters has been in part due to the more extensive display of warning signals referred to, and in part to the greater attention paid by shippers and seafaring men to the warnings.

The following instances, occurring during the year, are given as illustrations of the varied uses to which the sea-coast service can be applied:

The Haytien brig Tropic, Captain Potter, from Marigone, Hayti, for New York, with logwood, 15 days out, came ashore near Barnegat, N. J., at 3.30 a. m., March 16, at a point 14 miles south of station, during a dense fog. Private Burrows, the repairman from this station, was on his way south, and, upon his arrival at the scene of wreck he immediately cut the wire and made telegraphic report to the Chief Signal Officer, via Sandy Hook. The line being down south, he then proceeded and repaired it, then retured to the wreck and reopened wreck station at 5 p. m., March 18, reporting direct to the Chief Signal Officer.

January 26, Captain Fitzgerald wrote to this office and stated that he intended taking the H. B. Plant, a small river steamer, from Wilmington, Del., to Jacksonville, Fla., by sea, and that before leaving Delaware Bay he would telegraph for the "Indications" for the next twenty-four hours; on the same date he was informed, by letter from this office, that any telegram received from him, relative to the weather, would be promptly answered; at the same time he was furnished with a list of the stations of the Signal Service on the Atlantic coast from Delaware Breakwater, Del., to Jacksonville, Fla., and with the circular on the coast signal service, giving danger or distress signals. On February 9, Captain Fitzgerald telegraphed this office that steamer Plant would be at Lewes, Del., at midnight, and requested a special report as to wind and sea from Cape Henlopen to Savannah. The required information was telegraphed him at the Signal Service station at Delaware Breakwater. On the same date (February 9), Captain Fitzgerald wrote to this office from Wilmington, Del., stating that he intended to leave port at 3 p. m., and would stop at Delaware Breakwater for midnight Indications, and that in going down the coast, if he passed near enough the shore for the observers in charge of the stations of the Signal Service to see him, he would request that if bad weather be expected the "Union Jack" would be hoisted; if good weather the American flag be hoisted. Instructions were immediately telegraphed, from this office, to the observers in charge of the stations at Cape Henry, Va., Cape Hatteras, Cape Lookout, and Smithville N. C., to look out for the steamer Plant, give all possible information, and ask for information from this office; also to signal him as desired. On the mornings of February 10 and 11, the Indications were telegraphed to Captain Fitzgerald at Delaware Breakwater. The Plant arrived off Cape Henry, Va., on the 11th. The captain sent a boat ashore and telegraphed to this office for a special report of weather. He was telegraphed in reply as follows: "Severe storm approaching from the west; it will not be safe to leave Norfolk to-night or to-morrow." Upon the receipt of this telegram the captain ran his vessel into Hampton Roads and came to anchor. Captain Fitzgerald states in regard to this warning that it certainly saved his life and his vessel, as she could not have lived outside that night. He was telegraphed again from this office on the morning of the 12th, "Telegram of last night holds good to-day; no change in Indications; if any favorable change to-day will notify you at six o'clock." And again at 6 p. m., "Remain at Norfolk until notified of safety; second storm coming from southwest." At 12.42 a. m., February 15, the observer at Cape Henry was ordered to signal Captain Fitzgerald the following message and to prevent his leaving that station: "Will not be safe for you to leave Norfolk to-night." The Plant arrived Beaufort Harbor on the 17th and telegraphed to this office for Indications, and received the following answer: "Light southerly winds and a quiet sea expected." She then proceeded on her way and reached Jacksonville in safety.

The total number of messages received over the sea-coast line during the year ending June 30, 1880, was ten thousand seven hundred and fifty-two; the total number sent in same period, twelve thousand eight hundred and forty-two, or a total of twenty-three thousand five hundred and ninety-four messages received and sent; which would have cost, at regular tariff rates, fifteen thousand five hundred and eighty-one dollars and thirty-nine cents.

The Chief Signal Officer urges, as in preceding years, the maintenance, proper equipment, extension, and rapid working of the sea-coast lines and the sea-coast service. The temper of the nation can well be judged from the experience had in the instances of the Huron and Metropolis disasters. There is no thought on the part of the people of any parsimonious economy nor tolerance of delay in the impatience with which they demand, on occasions of disaster, that succor shall be given to any imperiled life on the instant without consideration of cost. There is no question of the general joy with which every report of successful effort in this direction is received. There is no time for slow-paced messengers when disasters are announced.

Whatever the difficulties of maintaining these lines practically on the sea-coast itself, and where the beaches and lines upon them are sometimes swept away together by the surge, the lines must be maintained. The saving of a single ship or of a single life compensates the cost of repairs. The fields of usefulness are so wide that it would be criminal to turn from them.

If wooden lines fail, as they may on the coast, there is every reason to believe the iron lines will not. Orders are now issued to substitute as rapidly as possible iron for wooden supports. One hundred and fifty miles of "iron line" are now standing on the coasts. The records of the coming year will show whether the results expected from these lines are overestimated. The time is not far distant when the possession of a coast not covered by sea-coast telegraph, not guarded by a sea-coast storm-signal and signal service, and not supplied with the force and means of aid at life-saving stations, will be held as much an evidence of semi-barbarism as is now among civilized nations the holding of any national coast without a system of light-house lights.

The description of the sea-coast service has been made minute in this and in preceding reports, because it is desired to show that a force of trained soldiers doing a land duty on shore, displaying signals hoisted on land though answered from ships; watching as sentinels, each his special "beat" of sea and shore; telegraphing messages by electric wires to summon aid, or telegraphing them by the same flag and torch signals they use in war when the lines are gone; erecting and keeping up their own wire lines of telegraph; displaying storm warnings by day or at night; making the regular meteorological observations, that the warnings may be ordered—in effect, a regular sentinel force to warn and to aid in any danger, all in strict military subordination to each other by their grades, and all to the central office, are a force of soldiers as usefully employed for purpose of peace, and as ready by training for war, as a force can be kept.

There is devolved upon this office by law the duty of providing all signals to be officially displayed as coast-signals, or recognized as such on the coasts of the United States.

To carry into effect the provisions of this law, there was issued from this office in January, 1878, a partial code of danger or distress signals to be used and recognized anywhere on the coasts of the United States, where there may be sea-coast stations of the Signal Service, and by official co-operation of the Life-Saving Service, to be organized also at any life-saving station. Copies of this code are furnished gratuitously to every vessel, of whatever nationality, taking clearance at any of our principal ports, and to coasting as well as other vessels upon application to this office. It is the aim to permit no ship within the protection of the United States, within its ports or upon its coasts, to be in case of danger or distress without the means of communicating with the land or with the parties whose duty it may be to aid in the rescue. A further simple code of night-signals is in preparation.

In pursuance of the acts of Congress authorizing the construction and operation of telegraphic lines in the interior and upon the frontier, for connecting military posts and stations, and for the protection of the population from Indian and other depredations, officers and enlisted men of the Signal Corps have been continued upon these duties. The lines in Arizona, New Mexico, and upon the Texan frontier, hitherto provided for, are completed. The lines in the Northwest, for which provision is made, are pushed rapidly forward. The work of construction has been in large part done by working parties furnished by the active co-operation of department commanders. A total length of five thousand and seventy-nine miles of frontier line is now operated and maintained in the care of officers and enlisted men of the Signal Corps. (Map 22.)

The uses of the frontier telegraph lines passing through the Indian country, as employed in military operations against war parties of Indians in motion, as well as their uses in advancing the progress of civilization by the safety and sense of protection they give to settlers near the scattered hamlets or military posts, have been referred to. A telegraph line, well worked, forms one of the most efficient of barriers against the raids of Indian war parties. The country on the frontier through which such lines pass has but few points at which water can be had. The posts occupied by the Army are scattered along the line at intervals of several hundreds of miles. The object in view, with Indian war parties, is to pass between the posts and settlements without disturbing any of them; and they very much dread to leave any danger in their rear, or to so alarm the country as to cause their retreat to be cut off in their return toward the region occupied by their tribe. The existence of the telegraph line enhances both these dangers. It is useless to break it as the parties pass toward the scene of their incursion, for this alarms both the posts and the settlements on both sides of the break, and brings repairmen and guards at once to the point of the break and upon their trail; nor does it stop communication between the posts, for messages may be sent circuitously by other wires, perhaps covering hundreds of miles of distance around the point at which the line has been disabled. If the wire is not broken when the trail passes the line, the troops can of course be very readily called upon whenever or wherever the parties may be discovered. But even if the line is passed safely and the trail is not detected, the danger the electric wires cause is not ended.

Wherever the party may strike, if the blow falls near any settlement or station connected with the telegraphic network, the alarm becomes in a few hours general. The troops on the line they have just passed know there is a war party in the field; other troops and other settlements can be aroused. The line of the Indian retreat, the points they must pass to reach water, are approximately known, and while the pursuit goes on in the field, other forces can occupy the passes and points in advance of the flying tribe. There can be no constructions more important for holding a frontier or protecting the first steps of advancing civilization than the telegraph lines. In instances occurring in Texas, New Mexico and Arizona, the movement of troops and of material, directed by telegraph, upon alarm sent by telegraph from settlements upon the frontier system of lines, has been so timely as to have attained results which could not, without the rapid action made possible by the lines, have been hoped for. How much of life and property have been saved from attacks thus guarded against, which else might have been made on defenseless communities, can be conjectured only.

From each of the stations on the telegraph lines thus in charge of the Signal Corps, a daily meteorological report is had and used, the whole forming a valuable portion of the office data each day discussed. The lines thus doubly useful are economically and successfully conducted.

The saving in the cost of reports and the sums received for commercial messages make the lines in part self-supporting.

The existence of the lines in the interior of Texas has long permitted warnings to be exhibited on the coast of that State where they were before impracticable. The lines in the Northwest will permit a series of reports not otherwise attainable, the study of which is of the first importance to a proper care for the commerce of the lakes and to other great interests east of the Mississippi.

Appropriations made by Congress have permitted work to be continued, and to be pressed with rapidity upon telegraphic lines extending westward in the vicinity of and covering the northwestern frontier. These lines mentioned as necessary in preceding reports of the Chief Signal Officer are already completed, and telegraphic connection is now established with lines extending eastward from the Pacific coast. These lines are of the first importance for the protection and development of this frontier and the regions through which they pass. There is no region in which the proportional increase of values, or the number of enterprises undertaken, have been greater during the year closing with the date of this report.

Fewer difficulties than were anticipated have been encountered in the construction. It would be difficult, after the experience of the service in line constructions in Western Texas, parts of New Mexico, and Southern Arizona, to encounter any which would be held to render such constructions impracticable. The adoption of iron supports makes it possible to carry a line over any ground on which the supports can be made to stand.

The force of the Signal Service will enable it to successfully occupy the lines already contemplated in existing legislation without additional details.

Arizona division.—First Lieut. C. A. Booth has remained in immediate charge of the lines in this division, pursuant to Special Orders No. 46, Adjutant-General's Office, February 28, 1878, and instructions from the Chief Signal Officer. The total length of line now in operation in this division is nine hundred and seventy-four miles. There are eighteen stations, from six of which full meteorological reports are received tri-daily by telegraph. From twelve of these a sunset observation is forwarded daily by telegraph. The lines have undergone general repairs during the year. The total receipts of the line during the year ending June 30,1880, were twenty-five thousand three hundred and ninety-two dollars and twenty-four cents, of which amount ten thousand one hundred and four dollars and eighty-seven cents were receipts for this line, and fifteen thousand two hundred and eighty-seven dollars and thirty-seven cents were received to be paid to other lines. The amount of official business not charged, for the same period, was, estimated at regular rates, ten thousand seven hundred and eighty dollars and eighty-seven cents.

The following-named stations were in operation June 30, 1880: Burkes, Ariz.; Campo, Cal.; Camp Thomas, Fort Apache, Fort Bowie, Fort Grant, Fort Lowell, Fort Verde, Florence, Maricopa, Phœnix, Prescott, and San Carlos, Ariz.; San Diego, Cal.; Tres Alamos, Tucson, Wickenburg and Yuma, Ariz.

The station at San Carlos, established December 6, 1879, is the only additional one opened during the year. Owing to the nature of the country through which they pass, these lines are maintained with great difficulty. During the past year the lines have been rebuilt in many places, and extensive repairs have been made, in some sections iron poles being substituted for wooden ones. Notwithstanding the many difficulties encountered, the lines have worked better this past year than during any year since their construction.

The following-named stations were inspected during the year: Burkes, during September; Campo, August and November; Camp Thomas, October and December; Fort Apache, December; Fort Bowie, October and January; Fort Grant, October and September; Florence, October and December; Maricopa, January; Fort Lowell, October and December; Fort Verde, September and December; Phœnix, September and December; Prescott, September and December; San Diego, October and November; Tres Alamos, October and December; Tucson, October and December; Wickenburg, September and December; Yuma, September and November.

New Mexico division.—First Lieut. James Allen, acting signal officer, has been in charge of this division during the fiscal year ending June 30, 1880. The total length of line now in operation is 486 miles.

The line from Shakspeare to Santa Fé received thorough repair during the year. A great many special and local repairs were made by operators and repairmen as they were needed.

The establishment of a station at Shakspeare, nearly midway between Silver City and Fort Bowie, has facilitated repairs in that section and has served to keep up a better communication between this and the Arizona division.

In the field operations against hostile Indians, in which the United States troops have been engaged during the year, the line has proven of inestimable benefit to the government. It has enabled the department commander, General John Pope, and district commander, Col. Edward Hatch, to communicate rapidly with troops in the field and at posts, to warn exposed settlements, and to receive early and reliable news of the depredations and whereabouts of hostile Indians, thereby saving the lives and property of citizens and preventing unnecessary hardships and loss of time in connection with the movements of troops, by all of which the government was spared untold expense.

The city of Santa Fé is to-day a very important military post, the operations of more than four regiments of United States troops being directed from headquarters in this city, and the headquarters of a district or department commander will more than probably remain in this city for years to come. A line, therefore, owned and operated by the government, connecting the different military posts, is of great value and importance.

The district commander, Col. Edward Hatch, has taken a deep interest in the line, and owing to his generous and prompt assistance it has been possible to keep the line in good condition and repair during the year.

There are thirteen stations on this line, at five of which complete observations are taken and telegraphed daily.

The following-named stations were in active operation June 30, 1880: Albuquerque, Aleman and Belen, N. Mex.; El Paso, Tex.; Fort Bayard Fort Craig, Fort Cummings, La Mesilla, Los Lunas, Santa Fé, Shakspeare, Silver City, and Socorro, N. Mex.

The total receipts of the line during the year ending June 30, 1880, were twelve thousand eight hundred and forty-nine dollars and fifty-one cents, of which amount seven thousand five hundred and twenty-two dollars and three cents were receipts of this line, and four thousand three hundred and twenty-seven dollars and forty-eight cents were received to be paid to other lines.

The following is the record of inspections made of stations on this line during the year by Lieut. James A. Buchanan, acting signal officer: Albuquerque, Aleman, Belen, El Paso, Fort Bayard, Fort Craig, Fort Cummings, La Mesilla, Los Lunas, Santa Fé, Silver City, and Socorro, during the month of May.

Texas division.—First Lieut. C. A. Tingle, acting signal officer, has been in charge during the year.

During the past year two hundred and sixty-three miles of telegraph line have been constructed, making the total length of line in this division one thousand seven hundred and twenty-three miles.

This extension was constructed under the supervision of Lieut. James A. Swift, Signal Corps, U. S. A., and reaches from Fort Sill, Ind. T., to Fort Elliot, Tex., passing through Wichita Indian Agency, Fort Reno, Cantonment, and Fort Supply, at each of which points offices have been established.

The line has worked well during the year. Automatic repeaters have been substituted for button repeaters at Concho and Jacksborough, and soon will be at Stockton, when it will be practicable to work the entire lines in this division over one circuit.

During the last half of the fiscal year, owing to the fact that all available transportation in the Department of Texas has been engaged in moving troops, it has been difficult to obtain details and transportation for general, and even for ordinary, repairs. Only such repairs have been made as were absolutely necessary for the removal of interruptions to the working of the lines. As soon as transportation is again available extensive repairs will be made.

The substitution of iron for wooden supports has progressed as rapidly as possible, and there are now 5,718 iron poles in use in this division. Kenosha insulators have been replaced by screw glass, except on several sections soon to be rebuilt.

The increase in the business of the line during the past year has been sensibly felt in its operation, and, in connection with the additional strain on its capacity, induced by working the entire line in one circuit, has kept the line constantly busy.

During the month of October, through the courtesy of the Missouri, Kansas and Texas Railway Company, a loop was run from their line in this city into this office, by which arrangement observatory time has been procured from Jefferson City, Mo., and Denison time is now telegraphed daily to all offices in this division, and also to Mesilla, N. Mex., from whence it is supplied to the stations in the New Mexico and in the California and Arizona divisions.

The following-named stations were in active operation in the division June 30, 1880, viz: Denison, Pilot Point, Decatur, Jacksborough, Henrietta, Tex; Sill, Ind. T.; Graham, Griffin, Coleman City, Concho, Stockton, Davis, McKavett, Mason, Fredericksburg, Boerne, San Antonio, Castroville, Uvalde, Brackettville, Eagle Pass, Laredo, Rio Grande City, Edinburgh, Santa Maria, Brownsville, Live Oak Ranche, Tex.; Wichita Agency, Fort Reno, Cantonment, Supply, Ind. T.; and Elliot, Calahan, and Grierson Springs, Tex.

The following-named stations were inspected during the year: Boerne, May, 1880; Brackettville, May, 1880; Brownsville, April, 1880; Castroville, May, 1880; Coleman City, March, 1880; Concho, March, 1880; Davis, April, 1880; Decatur, March, 1880; Denison, March, 1880; Eagle Pass, May, 1880; Edinburg, April, 1880; Fredericksburg, May, 1880; Graham, January and March, 1880; Griffin, January, 1880; Jacksborough, March, 1880; Laredo, April, 1880; Mason, June, 1880;

McKavett, June, 1880; Pilot Point, March, 1880; Rio Grande City, April, 1880; San Antonio, May, 1880; Stockton, April, 1880; Uvalde, May, 1880; Supply, December, 1879.

The aggregate cash receipts from telegraph tolls on messages transmitted over the lines of this division for the year ending June 30, 1880, were twenty-four thousand six hundred and six dollars and fifty-one cents, of which amount sixteen thousand and twenty-three dollars and sixteen cents were receipts for this line, and eight thousand five hundred and eighty-three dollars and thirty-five cents were received to be paid to other lines. The amount of official business, not charged, for the same period, was ten thousand eight hundred and seventy-two dollars and twelve cents.

Northwestern division.—First Lieut. George S. Grimes has remained in immediate charge of the lines in this division, pursuant to Special Orders No. 215, Adjutant General's Office, dated October 5, 1878, and instructions from the Chief Signal Officer.

The total length of line now in operation in this division is 1,652$\frac{199}{300}$ miles. There are thirty-seven stations, from eleven of which full meteorological reports are received tri-daily by telegraph, and from one, partial reports; from fourteen of these sunset observations are forwarded.

The line in operation on June 30, 1880 (854.51 miles), has been kept in thorough repair, and in addition 798$\frac{23}{150}$ have been added to the division, extending the system from Bozeman, the western terminus, through Helena, Fort Shaw, and Benton, Mont., to Fort Assinniboine, Mont., the present northern terminus, and from Helena west through Deer Lodge to Fort Missoula, Mont., the western terminus.

The line terminating at Fort Meade, Dak., has been extended east through Rapid City to Fort Bennett, Dak., on the west bank of the Missouri River, and to Fort Sully, Dak., on the east bank; thence north along the east bank to Fort Yates, Dak., and Fort Abraham Lincoln, Dak., and the west bank to Bismarck, Dak.

The total receipts of the line during the year ending June 30, 1880, were fifteen thousand nine hundred dollars and forty-five cents, of which amount eight thousand four hundred and twenty-six dollars and nine cents were receipts for this line, and seven thousand four hundred and seventy-four dollars and thirty-six cents were received to be paid to other lines. The amount of official business not charged for the same period was, estimated at regular rates, seven thousand nine hundred and eighty-seven dollars and seventy-five cents.

The following stations were in operation June 30, 1880: Bismarck, Dak.; Bozeman, Burns' Ranch, Coal Banks and Coulsen, Mont.; Deadwood, Dak.; Deer Lodge, Ferry Point and Fort Assinniboine, Mont.; Fort Bennett, Dak.; Fort Benton, Mont.; Fort Buford, Dak.; Fort Custer, Fort Ellis and Fort Keogh, Mont.; Fort A. Lincoln and Fort Meade, Dak.; Fort Missoula, Mont.; Fort Shaw, Fort Stevenson, Fort Sully, Fort Yates and Grinnell's Ranch, Dak.; Helena, La Bean's, Little Missouri and New Chicago, Mont.; Plum Creek, Dak.; Powder River and Radersburg; Rapid City, Dak.; Rock Creek, Rose Bud and Shield's River, Mont.; Smithville, Dak.; and Stillwater and Terry's Landing, Mont.

The following-named stations were established during the year: Regular stations, Bozeman, Helena, Fort Shaw, Fort Benton, Fort Assinniboine, Deer Lodge, New Chicago, and Fort Missoula, in Montana; and Fort A. Lincoln, Fort Yates, Fort Sully, Fort Bennett, and Rapid City, in Dakota. Repair stations: Rock Creek, Coal Banks, and Radersburg, in Montana; and Smithville, Plum Creek, and La Bean's, in Dakota.

In consequence of the extra labor and responsibility imposed on the officer in charge, caused by the extension and working of the lines of the division from $854\frac{51}{100}$ miles on June 30, 1879, to $1,652\frac{199}{300}$ miles on June 30, 1880, no formal inspection has been made of the several stations.

Washington Territory division.—The line had been completed and offices equipped at Dayton and Pomeroy, Wash., and at Lewiston and Fort Lapwai, Idaho, on July 1, 1879. These offices have been maintained, and no others on this portion of the line have been opened during the year. Communication over the whole length of the line from Dayton, Wash., to Fort Lapwai, Idaho (72 miles), has been interrupted only upon one occasion, from January 9 until January 17, 1880, caused by the span across Snake River at Lewiston blowing down during a severe gale. Communication was then maintained by flying station at the break. The work on the extension of the line from Pomeroy to Cœur d'Alene and thence eastward toward Missoula was begun at Pomeroy, Wash., on June 15, 1880. The working force consists of Company C, Twenty-first Infantry, under command of Lieut. F. J. Patten. The line was built to Almota, a distance of 23 miles, on June 27, and the span of 1,500 feet successfully stretched across Snake River with the assistance of Captain Gore, with the Oregon Railroad and Navigation Company's steamboat, the Almota. The office at Almota was equipped on June 28, 1880, but not manned, owing to a scarcity of operators. The work of extension is being vigorously pushed northward at the average rate of 2½ miles per day. Every assistance for which application to headquarters of the department has been made has been speedily granted.

The line was in charge of First Lieut. S. C. Vedder, Nineteenth Infantry, acting signal officer, from July 1, 1879, until November 7, 1879, at which time Sergeant Frank Greene, Signal Corps, U. S. A., was placed in temporary charge and remained until May 10, 1880, when First Lieut. Wm. E. Birkhimer, Third Artillery, acting signal officer, assumed charge of the line and remains in charge. It has not been visited by an inspecting officer since its construction, nor have the different offices been officially inspected by the superintendent, owing to his being wholly (almost) employed in preparing for and prosecuting the work of extending the military line to Cœur d'Alene Fort, and thence to the summit of the mountains. I have seen, however, the line from Dayton to Lewiston, and it is a credit to its builders.

The total receipts of the line during the year ending June 30, 1880, were two thousand three hundred and five dollars and twenty-eight cents, of which amount eight hundred and thirty-three dollars and twenty-six cents were receipts for this line and one thousand four hundred and seventy-two dollars and two cents were received to be paid to other lines. The amount of free business not charged for the same period was five hundred and fifty-eight dollars and fifty-three cents.

This rapid extension of all the lines has been made possible by the energetic assistance rendered by the local military authorities, by whom the transportation of material has been largely furnished. The troops at the several posts have performed most of the manual labor of constructing the line. Without such help the small appropriation available would not have furnished the desired telegraphic communication.

The Chief Signal Officer proposes, in the next annual report, to make mention of all officers who have been commended for services in the construction of these lines. The list is not yet complete.

The difficulties surrounding the work of construction and the management of these lines have been before referred to. At the inception, the undertaking was a new one; the appropriations small; the country difficult; a force had to be provided and organized to work the lines while the lines themselves were in construction; the laws controlling the duty were hardly understood; the service was subject to interferences not legal and to oppositions wholly unwise. It was not understood often that services of this kind must grow slowly.

It was not considered often that the difficulties of the construction, repair, and operations of these lines, limited to a single wire, extended for hundreds of miles through wildernesses, in sparsely-settled territories, without railways, and threatened always by Indians or other hostile forces, are different, much greater, and not at all to be compared with those of maintaining commercial lines, following railways, existing in the midst of settled civilization, and with every appurtenance at hand at many points, to move instantly by rail, along the lines, for their immediate restoration and repair, if they chance to be damaged. It is, however, from the anxious settlers in this wilderness and upon the distant frontiers that the most urgent appeals are forwarded, both that existing lines may be maintained and that additional lines may be constructed. It is here they are located by law, and it is for the commercial development as well as the protection of these regions that the lines are of the greatest importance. It is an absolute necessity for the especial duties of this office that these regions be penetrated.

The difficulties above referred to lessen. It is better understood in each ensuing year that systems of telegraphic lines to be worked at all must be worked as a unit. The laws of the United States and the orders which have so determined are more closely obeyed. Illegal and unauthorized interferences are less frequent. It is better comprehended that lines conveying, as they may, commercial or official business from one extreme of the United States to another, ought not by possibility to be interfered with in their working by any subordinate authority.

Tests of the accuracy and rapidity of the working of these lines, made for a comparison in these respects with other lines under different management, but in country similar in character, have given satisfactory results. The working of the lines improves steadily. When it shall have become possible, as it will with better knowledge of their usefulness, to station along the lines repair parties, sufficient in number and properly located, and to provide material at depots so distributed as to be always and easily accessible, there will be no reason why these lines should be disabled for other than very brief periods. It is impossible to protect absolutely from frequent brief interruptions any line constructed with a single wire. It is in view to double the wires as rapidly as the appropriation and powers of the office will permit.

The fact that the especial duties of this office require reports from all the lengths of all its lines three times daily in the regular discharge of its daily duties, affords opportunities for and causes an inspection more regular and frequent, perhaps, than that had on any lines not under similar supervision.

The use of iron supports, succeeding as it has under the tests to which it has been this year subjected, by the practical uses of such supports in the lines actually constructed, has shown a great advance in line construction. It is difficult to estimate the importance to the United States and to the service of a mode and material for line construction capable of being put in use and lasting everywhere.

The tests made with the telephone at this office and on the sea-coast assure the fact that many posts and stations near main lines may have a telegraphic communication over those lines which has been hitherto impossible.

There are no constructions more economical, or returning, by their use, more fully their value to the people and the Army of the United States, than the electric lines now stretching among the frontier posts and settlements.

The office is again called upon to acknowledge the courteous and prompt aid with which the wishes of the Secretary of War have been met on the part of division, department, and district commanders, and the zeal with which the working parties of troops by them detailed have performed their duties.

In the different works of construction, important assistance has been rendered by Lieut. Gen. P. H. Sheridan, commanding Military Division of the Missouri; Brig. Gen. O. O. Howard, commanding Department of the Columbia; Brig. Gen. A. H. Terry, commanding Department of Dakota; Brig. Gen. E. O. C. Ord, commanding Department of Texas; Brevet Brig. Gen. Edward Hatch, commanding District of New Mexico; and Brevet Brig. Gen. O. B. Willcox, commanding Department of Arizona. The work would have failed in much of its success but for this powerful aid.

The military results foreshadowed as to follow the construction and use of these interior lines are already in part attained. The reports of officers commanding campaigns, or employed in other operations, evidence at once the wisdom with which these added facilities for communication have been employed, and the success of operations to which the rapid communication so secured have, under their direction, contributed.

In closing this report the Chief Signal Officer again refers to the frequent rehearsal of facts hitherto stated in preceding reports upon the service. The annual reports of the succeeding years, rehearsing, as they must, similar facts of organization and of service, become more closely repetitions of the preceding reports, to which are added, each year, such statements of progress as relate to the year present.

The Chief Signal Officer anticipates the best results to the Signal Service from the legislation of 1878. There could hardly have been an act wiser for the interests of the service or more just to the members of it. The favorable action of Congress has removed difficulties which had hampered the progress of the duty for years. If its work is permitted to go on as it has been planned, and is fairly sustained, it can hardly fail in continued success. There ought to be just provision for the permament employment and grades of the officers of the corps. It is recommended this be fixed by legislation. It is hoped there may be no failure in the appropriation for the service of the amounts estimated for this year. They have been estimated with careful economy.

The progress of the service through the years of duty past has been attended with steady and satisfactory success. There is no longer question as to the useful preannouncement of meteoric changes. The plans extend more broadly in each succeeding year, by which to aid in every interest of commerce and agriculture. The popular confidence and support have been unchanging and considerate. A world-wide study has been developed, and aims to attain results not contemplated a few years ago as possible. The scope of practical usefulness increases with each year. The road grows broader and plainer as it leads towards success.

R. C. DRUM,

Adjutant-General, and Acting Chief Signal Officer of the Army.

PAPER 1.

COURSE AT FORT WHIPPLE, VIRGINIA.

(Exclusive of the drills in the arms, with trains or for permanent construction.)

OFFICERS.

The course of instruction for officers is both practical and theoretical. The theoretical portion comprises instruction in the following books, viz: The Manual of Signals, The International Code of Flag Signals, Official Danger and Distress Signals, Pope's Practical Telegraphy, Culley's Hand-book of Telegraphy, Loomis' Meteorology, Instructions to Observer Sergeants, the Cipher Manual. The supplementary course of reading comprises in the cases of officers permanently detailed for the full duties of the Signal Service, in addition to especial works from time to time designated: The Practical Uses of Meteorological Reports and Weather Maps, Smithsonian Directions for Meteorological Observations, Buchan's Handy Book of Meteorology, Piddington's Horn Book, Espy's Philosophy of Storms, Fitz Roy's Weather Book, Martin's Rotary Theory of Storms, Ley's Laws of the Winds, Espy's First Meteorological Report, Espy's Fourth Meteorological Report. The practical portion consists of wand practice, which is continued until the officer can read messages at the rate of ten words per minute; practice in the field with flag and torch in general service; homographic, chronosemic, and international codes of flag-signals and various kinds of ciphers, and practice with the heliograph in the General Service Code.

The ranges for practice are from a few hundred yards to eighteen miles in extent with flag and torch, and extreme long range of thirty-one miles with the heliograph.

The officers have practical instructions in telegraphy (General Service Code) until they can send and receive at the rate of ten words per minute, and are required to make drawings of the various telegraph instruments and electrical batteries in use in the Signal Service.

ENLISTED MEN.

Instruction No. 36.

WAR DEPARTMENT,
OFFICE OF THE CHIEF SIGNAL OFFICER,
Washington, D. C., April 16, 1878.

The following course of instructions is prescribed for enlisted men at the School of Instruction of the Signal Service at Fort Whipple, Va.:

Sergeants ordered to Fort Whipple, Va., for change of station, misconduct, or any cause other than "review of theoretical course" will report to the instructor for wand, for field, and for telegraph practice, and for such duties, as non-commissioned officers, in connection with the course of instruction as may be necessary.

Sergeants ordered in from station for review of course, candidates for promotion, and recruits will be instructed in the following theoretical and practical course:

Signal Manual, page 15, from "A sign or signal," to page 96; and from "Description of equipments," page 189, to "Semaphore telegraph," page 195; from "Flags on halyards," page 198, to "Distance line," page 199; from "When working at night," page 206, to "Candle bombs," page 207; from "Manual of the kit," page 258, to middle of page 273; from "Field telegraph train," page 378, to "General directions, &c.," page 393; from "Permanent lines" to "General service," pages 399 to 466; International Code of Signals; Loomis' Meteorology, to page 193, omitting articles 125, 126, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, and 369; Official Danger or Distress Signals; Pope's Modern Practice of the Electric Telegraph, chapter 1, to page 45; page 57 to page 64, article 103; chapter 6, page 73, to article 122, page 78; chapter 7 and 8; Culley's Hand-book of Practical Telegraphy, Part I, page 1, to article 49, page 18; Part III, page 45, to article 120, page 57; article 130, page 71, to Part IV, page 76; Instructions to Observer Sergeants, entire book; Cavalry Tactics, through school of the company, dismounted.

Practical course.—Wand-practice daily for six weeks, or as much longer as necessary; field practice in the immediate vicinity of Fort Whipple daily, during theoretical course; practical instruction with Marean repeater and telephone; cleaning and setting up batteries; use and construction of all Morse instruments; establishing terminal and intermediate stations; cutting in on line; use and construction of all instruments used on station; method of correcting barometer; finding of dew-point and relative humidity; observation of clouds; cleaning barometer; telegraph practice daily, standard, ten words; practical instruction in splicing cables; forms, records of office, &c.

All men to have four tours of guard duty as non-commissioned officers; twelve days' and four nights' "field practice" in General Service Code, at long range; three days' practice in International Code, at long range.

Men on guard duty will not be excused from recitations; nor will they be excused from telegraph practice at hours when not actually on post. Men on duty in the observatory will be excused from company duty as now provided.

Recruits to perform company duty for two months previous to being ordered for theoretical instruction. Instruction during this time not to interfere with military duty.

All enlisted men reporting for duty to be instructed in cavalry tactics, through "school of the company," dismounted.

Flag, torch, train, &c., drills conducted as heretofore.

A schedule showing hourly occupation, from 9 a. m. to 9 p. m., of each man under instruction, will be kept by the instructor.

Instruction hours.—Recitations will commence at 9.45 a. m., and continue until all classes have recited. Telegraph practice at such hours between 9 a. m., and 9 p. m., as instructor may direct, each man to have, when practicable, at least two hours' practice daily. Study hours from 9 a. m., until 9 p. m., the time being so divided that each man may have at least three hours for the preparation of his daily lesson. During recitation and study hours the men under instruction will be required to be present at instruction building. The sergeant, or such other enlisted man as may be designated, will have charge of the study-room, and will be responsible to the instructor for the presence and orderly behavior of the classes during study and recitation hours. Instruction on Saturdays will be discontinued.

ALBERT J. MYER,

Brigadier-General (brevet assigned), Chief Signal Officer of the Army.

RECORD OF SIGNAL CAMP OF INSTRUCTION, FORT WHIPPLE, VA.

PAPER 2.

Officers instructed during the year ending June 30, 1880.

Name.	Rank and corps.	Reported for instruction.	Relieved from instruction.	Remarks.
J. A. Swift	Second lieutenant Signal Corps.	Mar. 19, 1879	....	Still under instruction.
L. E. Sebree	Second lieutenant Signal Corps.	Mar. 19, 1879	Mar. 1, 1880	Completed full course of signaling, telegraphy and meteorology.
W. S. Wyatt	First lieutenant Ninth Infantry.	Oct. 27, 1879	....	Still under instruction.
F. K. Ward	First lieutenant First Cavalry.	Nov. 17, 1879	May 24, 1880	Completed full course of signaling, telegraphy and meteorology.
J. S. Powell	Second lieutenant Signal Corps.	Feb. 5, 1880	May 24, 1880	Do.
W. A. Glassford	Second lieutenant Signal Corps.	Feb. 5, 1880	May 24, 1880	Do.
W. C. Buttler	Second lieutenant Third Infantry.	May 11, 1880	....	Still under instruction.
F. Von Schrader	First lieutenant Twelfth Infantry.	May 14, 1880	....	Do.

Table showing the number of cipher-words and messages sent and received by telegraph at the central office, Washington, D. C., from July 1, 1879, to June 30, 1880.

Cipher-words of weather reports sent	36,600
Telegraphic messages other than weather reports sent	13,570
Cipher-words of weather reports received	748,384
Cipher-words of special river reports received	7,076
Telegraphic messages other than weather reports received	18,560

PAPER 7.

Table showing meteorological data furnished from the records of the office of the Chief Signal Officer of the Army, upon the request of the applicants named, during the fiscal year ending June 30, 1880.

Wm. McMurtrie, esq., chemist, Department of Agriculture, Washington, D. C., furnished, July 8, 1879, with table showing average humidity for each month of the year at Burlington, Vt.; Denver, Colo.; Dodge City, Kans.; Galveston, Tex.; Indianapolis, Ind.; Jacksonville, Fla.; Memphis, Tenn.; Montgomery, Ala.; Nashville, Tenn.; New Orleans, La.; New York, N. Y.; Omaha, Nebr.; Pittsburgh, Pa.; Portland, Me.; Portland, Oreg.; Rochester, N. Y.; San Diego and San Francisco, Cal.; Shreveport, La.; Saint Louis, Mo.; Saint Paul, Minn., and Wilmington, N. C., from July, 1873, to June, 1879, inclusive.

Capt. Geo. M. Wheeler, Corps of Engineers, U. S. A., furnished, July 12, 1879, with table showing the readings of the barometer corrected for temperature, readings of dry and wet bulb thermometers and corresponding relative humidity, at 7 a. m., 2 p. m., and 9 p. m., each day, at Pike's Peak, Colo., from May 23 to June 15, 1879, and at Fort Garland, Colo., from May 13 to 22, 1879.

Mr. J. C. Neilson, architect, Staunton, Va., furnished, July 22, 1879, with statement showing the amount of precipitation at Mount Solon, Va., for each month, from January, 1878, to June, 1879, inclusive.

Mr. A. S. Cushman, Boston, Mass., furnished, July 24, 1879, with tables showing maximum, minimum, and mean temperatures, mean relative humidity, total amount of precipitation and prevailing direction and maximum velocity of wind at Leavenworth, Kans., for each month, from September, 1871, to June, 1879.

Capt. Geo. M. Wheeler, Corps of Engineers, U. S. A., furnished, July 25, 1879, with tables showing readings of barometer (reduced to freezing), and attached and dry and wet bulb thermometers; also, corresponding relative humidity (at 7 a. m., 2 p. m., and 9 p. m., each day), at Pike's Peak, Colo., from May 13 to 22 and from June 16 to 24, inclusive, and at Sacramento, Cal., from May 16 to June 27, 1879.

Mr. T. R. Tannett, agent Oregon Steamship Company, &c., New York City, furnished, August 16, 1879, with tables showing monthly and annual amount of rain-fall and monthly maximum, minimum, and mean temperature, for each month, at Portland, Oreg., from January, 1878, to July, 1879; at Roseburg, Oreg., and Olympia, Wash., from July, 1877, to July, 1879, and at Umatilla, Oreg., from August, 1877, to July, 1879, inclusive.

Joseph M. Pray, esq., attorney at law, Brooklyn, N. Y., furnished, August 18, 1879, with tables showing state of weather at each observation, together with time of commencement and ending, and amount of all precipitation at New York City from November 1 to December 20, 1879.

Mr. G. A. N. Silgencrantz, U. S. Engineer's Office, Chicago, Ill., furnished, August 12, 1879, with tables showing daily maximun and minimum temperature at Chicago, New Orleans, San Francisco, and Washington from July 1, 1878, to June 30, 1879, inclusive.

Dr. C. Spinzig, Saint Louis, Mo., furnished, August 19, 1879, with tables showing mean barometer and temperature and amount of precipitation at Memphis, Tenn., for each month from January to July, 1879, and for each day from July 1 to August 9, 1879, inclusive.

Mr. William H. Fleming, North Conway, N. H., furnished, August 22, 1879, with statement showing mean humidity and extreme range of temperature, the humidity for each month of 1874, 1875 and 1876, and the range of temperature for each month in the years 1875, 1876 and 1877, at Sandy Hook, N. J.

Capt. Edwin Pollock, Ninth United States Infantry, Washington, D. C., furnished, September 3, 1879, with table of maximum, minimum, and mean temperature at Cheyenne and Camp Brown, Wyo., from January to December, 1877, inclusive.

Messrs. Hamilton & Co., produce and commission merchants, Louisville, Ky., furnished, September 15, 1879, with tables showing state of weather and readings of exposed maximum and minimum thermometers at each of the seven daily observations at Chicago, Ill., and Louisville, Ky., from December 27, 1878, to January 5, 1879.

Mr. F. C. Briggs, Waterville, N. H., furnished, September 15, 1879, with record of maximum, minimum, and mean temperatures at Fort Monroe and Norfolk, Va., from July, 1877, to June, 1879, inclusive.

Mr. Verplank Colvin, superintendent Adirondack survey, Albany, N. Y., furnished, September 16, 1879, with record of barometer, attached, exposed, dry, and wet bulb thermometers and directions of wind at Albany and Oswego, N. Y., and Burlington, Vt., on September 7 and 8, and November 7, 1877 (five observations each day).

Mr. C. B. Salmon, treasurer Eclipse Windmill Company, Beloit, Wis., furnished, September 16, 1879, with record of the average and maximum velocity of the wind (in miles per hour) for each month from January, 1878, to June, 1879, at Sacramento,

Boise City, Salt Lake City, Bismarck, Pembina, North Platte, Dodge City, San Antonio, Shreveport, Fort Gibson, Leavenworth, Omaha, Saint Louis, Vicksburgh, Montgomery, Jacksonville, Augusta, Nashville, Indianapolis, Columbus, Detroit, Lynchburgh, Washington, Philadelphia, Rochester, and Louisville.

Mr. George H. Cook, State geologist, New Brunswick, N. J., furnished, September 22, 1879, with table showing maximum, minimum, and mean temperatures at Blooming Grove, Pa., for each month from January, 1874, to December, 1878, inclusive.

Mr. Wm. H. Fleming, North Conway, N. H., furnished, September 23, 1879, with tables showing mean relative humidity for each month of the year 1877, and annual maximum, minimum, and range of temperature for the years 1874, 1875, 1876 and 1877, at Sandy Hook, N. J.

Smith Townshend, M. D., health officer, Washington, D. C., furnished, September 25, 1879, with statement showing mean thermometer, mean barometer, mean humidity, rainfall (in inches), and prevailing direction of wind for weeks ending July 6, 1878, to July 5, 1879, at Washington, D. C.

Messrs. Gray & Loring, Boston, Mass., furnished, September 27, 1879, with copies of anemometer and anemoscope sheets at Boston, from 12 noon of April 17 to 12 noon April 20, 1876.

Mr. C. B. Salmon, treasurer Eclipse Windmill Company, Beloit, Wis., furnished, September 30, 1879, with statement showing average hourly and monthly velocity of the wind at Portland, Me., Albany, N. Y., Grand Haven, Mich., Boston, Mass., Pittsburgh, Pa., Corsicana, Tex., Cheyenne, Wyo., for each month from January, 1878, to June, 1879, inclusive.

Mr. Charles D. Palmer, office No. 1, Old State House, Boston, Mass., furnished, September 30, 1879, with statement showing the highest velocities of wind at Boston, Mass., Cape Henry, Va., Capes Hatteras, Lookout, and Kittyhawk, N. C., Mount Washington, N. H., North Platte, Nebr., Pike's Peak, Colo., and Sandy Hook, N. J.

Mr. Henry I. Bowditch, 113 Boylston street, Boston, Mass., furnished, October 6, 1879, with statement showing the mean daily temperature at Eastport and Portland, Me., and Boston, Thatcher's Island and Wood's Holl, Mass., from June 16 to September 16, inclusive, for the years 1876, 1877, 1878 and 1879; also, statement showing the direction of the wind and the state of the weather at the same points, for the same months, but for the years 1876, 1878 and 1879.

Messrs. Stein Bros., Baltimore, Md., furnished, October 23, 1879, with statement showing monthly maximum, minimum, and mean temperatures, amount of rain-fall, and prevailing direction of wind at Menlo Park, Cal., from March, 1878, to September, 1879, inclusive.

Park Benjamin, 37 Park Row, New York City, furnished, October 29, 1879, with statement showing maximum velocity of wind at Buffalo, Albany, and New York City during year ending June 30, 1879.

M. Laupheimer, 268 West Pratt street, Baltimore, Md., furnished, October 28, 1879, with statement showing the mean monthly percentage of relative humidity at Los Angeles and San Diego, Cal., during two years ending June 30, 1879.

Messrs. Schiaffino & Cossa, 21 South Gay street, Baltimore, Md., furnished, October 30, 1879, with direction and velocity of wind at 9 and 11.08 p. m., March 3, 1878, at Cape May, N. J.

Mr. W. L. Fawcett, 120 La Salle street, Chicago, Ill., furnished, October 31, 1879, with statement showing average amount of rain-fall, by weeks, in Ohio Valley and Tennessee region, the Upper Mississippi region, and the Lower Missouri Valley, from August 5, to October 27, 1879, inclusive, and total rain-fall from August 18 to October 18, 1879, inclusive, at Cincinnati, Indianapolis, Keokuk, Leavenworth, Nashville, Pittsburgh, and Springfield (Ill.).

A. S. Abell & Co., Sun Iron Building, Baltimore, Md., furnished, November 10, 1879, with data for eight years, from 1871 to 1878, embracing mean monthly barometer and thermometer, direction and highest velocity of wind, amount of rain-fall, average readings of each month of mean barometer and thermometer, prevailing direction of wind, and amount of rain-fall at Baltimore, Md.

Mr. Albert Marwick, No. 15 Exchange street, Portland, Me., furnished, November 11, 1879, with statement showing velocity of wind and direction and state of weather at Wood's Holl, Mass., at 5.01 p. m., 9 p. m., and 11.26 p. m., September 14, 1879.

Prof. J. W. Chickering, Washington, D. C., furnished, November 11, 1879, with statement showing readings of barometer reduced to sea-level at Knoxville, Tenn., at 7 a. m., 2 and 9 p. m., from September 8 to September 13, 1879.

Commissioner of Agriculture, Washington, D. C., furnished, November 12, 1879, with a statement showing mean daily barometer, maximum, minimum, and daily temperature, mean daily relative humidity, prevailing direction of wind, rain-fall and melted snow (in inches), and the character of the day, for each day in the year from November 1, 1878 to October 31, 1879, inclusive, at Louisville, Ky.

Mr. F. Staut, 1701 Indiana Avenue, Washington, D. C., furnished, November 14, 1879, with a statement showing the principal rains which occurred at Washington.

D. C., during September, 1877, with the highest velocities and prevailing direction of the wind.

Mr. M. Accame, 21 South Gay Street, Baltimore, Md., furnished, November 14, 1879, with a statement showing the direction and velocity of the wind at Cape May, N. J., at 9 p. m. and 11.08 p. m., March 3, 1878; 7 and 7.43 a. m. and 12.08 p. m., March 4, 1878, and the maximum velocities of the wind on the above dates and between the hours specified.

Maj. J. W. Barlow, Board of Engineers, Army Building, New York City, furnished, November 20, 1879, with a statement showing the dates, duration, direction, and maximum velocity of wind during the southwest and west gales which occurred at stations on Long Island Sound from October 1, 1878 to October 1, 1879, as recorded at the stations of observation at New York, N. Y., New London, and New Haven, Conn., and Wood's Holl, Mass.

Mr. James E. Miller, corner of Fourteenth and C streets, N. W., Washington, D. C., furnished, November 21, 1879, with a statement showing the times of commencement, ending and amount (in inches and hundredths) of all precipitation at Washington, D. C., between the hours of 7 a. m., and 5 p. m., from July 3, 1879, to November 20, 1879, inclusive.

Dr. J. Chandler, secretary board of health, Memphis, Tenn., furnished, November 22, 1879, with a statement showing the mean temperature, mean relative humidity, amount of precipitation, and total movement of the wind at Memphis, Tenn., during the months of June, July, August and September of each year from 1873 to 1879, inclusive.

Mr. H. W Graffen, Pottstown, Pa., furnished, November 25, 1879, with a statement showing the total rain-fall during the year 1878 at the following points: Toronto, Quebec, Halifax, Chatham, Kingston, and Montreal.

Mr. Morton P. Henry, No. 416 Walnut street, Philadelphia, Pa., furnished with a statement showing the direction and velocity of the wind and state of the weather at Cape May, N. J., at 4.43, 9 and 11.08 p. m. (local time), March 3, 1878, and 7 a. m., (local time), March 4, 1878; also, copy of anemometer record sheet of the station from 12 m., March 3, to 12 m., March 4, 1878.

Mr. G. A. Ogle, No. 3 South Charles street, Baltimore, Md., furnished, December 5, 1879, with a statement showing certain specified dates, during the months of June, July, August and September, upon which heavy rain-storms, of short duration, occurred at Baltimore, Md., from 1872 to 1879, inclusive, with the amount of rain-fall between the hours specified.

Mr. R. T. Loper, jr., Stonington, Conn., furnished, December 6, 1879, with a statement showing the direction and velocity of the wind at New London, Conn., at 9 p. m. and 11.19 p. m., of November 19, 1879.

Mr. J. P. Woolman, auditor Territory of Montana, Helena, Mont., furnished, December 8, 1879, with a statement showing the mean, maximum, and minimum temperatures for each month of the year, the prevailing direction of the wind, mean relative humidity, average amount of precipitation, and number of cloudy days in Winter, Spring, Summer and Autumn at Virginia City, Mont.

Director U. S. Geological Survey, Department of the Interior, Washington, D. C., furnished, December 15, 1879, with a statement of barometric readings taken at Salt Lake City, Utah, at the hours of 7 a. m., 2 and 9 p. m., each day from July 1 to November 30, 1870.

Admiral R. H. Wyman, Superintendent Hydrographic Office, Washington, D. C., furnished, December 17, 1879, with a statement showing the mean monthly barometer (corrected for temperature, elevation, and instrumental error), for each month in the years 1871 to 1878, inclusive, and for each month in the year 1879, excepting December, at Boston, Mass., New York, N. Y., Norfolk, Va., Philadelphia, Pa., and Washington, D. C.

Dr. F. P. Houskeeper, Coatesville, Pa., furnished, December 22, 1879, with a statement showing the temperature, amount of clouds, and the state of the weather at Philadelphia, Pittsburgh and Erie, Pa., on April 21, 1879.

Mrs. I. Armour, Arlington Hotel, Washington, D. C., furnished, December 23, 1879, with a statement showing the mean, maximum and minimum temperature for the months of December, January and February, 1876, 1877 and 1878, at Chicago, Ill., and Washington, D. C.

Secretary of the New Orleans Cotton Exchange, New Orleans, La., furnished, December 27, 1879, with a statement giving the rain-fall (in inches and hundredths), for each month in the year from September, 1876, to November, 1879, inclusive, at the following stations: Augusta, Ga., Baltimore, Md., Charleston S. C., Cincinnati, Ohio, Corsicana, Tex., Fort Gibson, Ind. T., Galveston and Indianola, Tex., Jacksonville and Saint Mark's, Fla., Knoxville, Memphis and Nashville, Tenn., Louisville, Ky., Lynchburgh, Va., Mobile and Montgomery, Ala., New Orleans and Shreveport, La., Norfolk, Va., Savanah, Ga., Vicksburgh, Miss., and Wilmington, N. C.

Mr. B. S. Fitch, general freight agent Chesapeake and Ohio Railroad, Richmond, Va., furnished, December 30, 1879, with a statement showing the state of the weather and amount of precipitation recorded at the stations of observation at Saint Louis, Mo., Little Rock, Ark., Shreveport, La., Cario, Ill., and Memphis, Tenn., on August 23, 24, 25 and 26, 1879.

Capt. W. A. Shaw, steamer Geo. M. Bird, Jacksonville, Fla., furnished, December 31, 1879, with a statement showing the direction and velocity of the wind at Jacksonville and Punta Rassa, Fla., at certain hours on December 27 and 28, 1878 and Februrary 5, 1879.

Mr. R. E. Craig, chairman meteorological committee, cotton exchange, New Orleans, La., furnished, January 3, 1880, with a statement showing the amount of rain-fall during the months of September, October and November, 1879, as compared with the same months of 1878, as recorded at the following-named stations of observation: Augusta, Cincinnati, Galveston, Knoxville, Memphis, Nashville, Savannah, Vicksburgh, Baltimore, Corsicana, Indianola, Louisville, Mobile, New Orleans, Shreveport, Wilmington, Charleston, Fort Gibson, Jacksonville, Lynchburgh, Montgomery, Norfolk and Saint Mark's.

Mr. Albert H. Campbell, Charleston, W. Va., furnished (through Col. John G. Parke, Corps of Engineers, U. S. A.), January 9, 1880, with a statement, showing the reduced barometer readings, the temperature and relative humidity, at the telegraphic observations taken tri-daily at Washington, D. C., Lynchburg, Va., Pittsburgh, Pa., and Cincinnati, Ohio, for each day from November 29 to December 31, 1879, inclusive.

Dr. C. C. Lathrop, secretary Colorado Medical Society, Denver, Colo., furnished, January 16, 1880, with a statement showing the maximum, minimum, and mean temperatures, mean relative humidity, prevailing direction of wind, total movement of the wind, and amount of precipitation, for each month of 1878 and 1879, at Cheyenne, Wyo., Denver, Colo., and Santa Fé, N. Mex.

Mr. Lawrence Moran, Aurora, Ind., furnished, January 16, 1880, with the total movement of wind, in miles, during the year 1879 at the following stations of the Signal Service, U. S. A., viz: Denver, Colo., Saint Paul, Minn., Sacramento, Cal., Dodge City, Kans., and Key West, Fla.

Mr. Treadwell Cleveland, New York City, furnished, January 16, 1880, with a statement showing the state of the weather, direction and velocity of the wind at each of the observations taken at Cape May, N. J., from October 1 to October 31, 1879, inclusive.

Messrs. Ropes, Gray & Loring, attorneys at law, Boston, Mass., furnished January 26, 1880, with copies of the record sheets from the self-registering attachment to the anemometer and anemograph at Boston, Mass., from 12 m., April 17 to 12 m., April 19, 1879.

Mr. George H. Boehmer, Smithsonian Institution, furnished, January 29, 1880, with a statement showing the amount of rain-fall at Fort Sully, Dak., for each month of the years 1874 and 1875.

Department of Agriculture, Washington, D. C., furnished, February 2, 1880, with a statement showing the monthly averages of rain-fall, temperature and relative humidity, and number of rainy days at Portland and Eastport, Me., Burlington, Vt., and Boston, Mass., for the year 1879.

John R. Fellows, attorney at law, New York City, furnished, February 9, 1880, with a statement showing the state of the weather at Sandy Hook and Barnegat, N. J., at 9 and 11.12 p. m., on July 30, 1879.

Mr. Woodbury Wheeler, attorney at law, Washington, D. C., furnished, February 10, 1880, with a statement showing the highest and lowest readings observed from a standard thermometer, read seven times daily, between 7 a. m. and 11 p. m., and the maximum and minimum temperatures from the self-registering maximum and minimum thermometers at 11 p. m., for each day from December 1, 1878, to January 15, 1879, inclusive, as recorded at the station of observation at Washington, D. C.

Mr. L. M. Zinicker, furnished (through General Stewart Van Vliet, Acting Quartermaster-General, U. S. A.), February 10, 1880, with a statement of the daily mean barometer and mean temperature for the year 1879, as deduced from observations taken at Washington, D. C.

Mr. Lawrence Moran, Aurora, Ind., furnished, February 12, 1880, with a statement showing the total movement of the wind, in miles, during the year 1879, at the following-named places: Leavenworth, Kans., Omaha, Nebr., Davenport, Keokuk and Des Moines, Iowa, Cairo and Springfield, Ill., Salt Lake City, Utah, Winnemucca, Nev., Indianola, Tex., and La Crosse, Wis.

Maj. W. J. Twining, Engineer Corps, U. S. A., Washington, D. C., furnished, February 17, 1880, with a statement showing the number of days on which rain fell, the amount of rain-fall, and the heaviest amount in any one day from April 26 to May 1, inclusive, and from May 16 to 21, inclusive, during the years from 1871 to 1879, inclusive, at Washington, D. C.

Mr. Clarence King, Director U. S. Geological Survey, Washington, D. C., furnished, February 19, 1880, with a statement showing the readings of the barometer, corrected for temperature and instrumental error, and the dry bulb thermometer and the relative humidity at Salt Lake City, Utah, at each observation from October 6, 1879, to January 25, 1880, inclusive.

Mr. Henry A. Hersey, Chicago, Ill., furnished, February 19, 1880, with a statement showing the mean relative humidity for each month of 1879 at Chicago, Saint Louis Cincinnati, New York and Louisville.

Mr. Thos. Jenkins, Commercial Publishing Company, Buffalo, N. Y., furnished, February 26, 1880, with a statement showing the mean temperature and mean range of temperature; the total amount of precipitation and total movement of the wind for each year from 1875 to 1879, inclusive, at Buffalo, Cleveland, Chicago, Rochester, Albany, Philadelphia, New York, Boston, Saint Louis, Saint Paul, San Francisco, New Orleans, Denver and Pittsburgh.

Mr. Clarence King, Director U. S. Geological Survey, furnished, February 28, 1880, with a statement showing the relative humidity at Salt Lake City, Utah, at the 7 a. m., 2 and 9 p. m., observations of each day from July 1 to November 3, 1879, inclusive.

Mr. Joseph Baker, Baker Wrecking Company, Norfolk, Va., furnished, March 1, 1880, with copies of the weather observations taken at Cape Henry, Va., on the 22d, 23d and 24th days of October, 1879.

Mr. W. H. Addrick, Philadelphia, Pa., furnished, March 5, 1880, with certain rain-fall data in connection with the storm at Nashville, Tenn., on February 12, 13 and 14, 1880.

General M. C. Meigs, Quartermaster-General, U. S. A., furnished, March 9, 1880, with a statement showing the amount of precipitation which fell at Fort Meade, Dak., from July 1, 1879, to January 31, 1880, inclusive; at Deadwood, Dak., from January 1, 1878, to January 31, 1880, inclusive, and at Lead City, Dak., from June 1 to October 31, 1878, inclusive.

General M. C. Meigs, Quartermaster-General, U. S. A., furnished, March 17, 1880, with a statement showing the amount of precipitation which fell at Washington, D. C., from May 1, 1879, to January 31, 1880.

Mr. W. H. Gardner, chairman meteorological committee, cotton exchange, Mobile, Ala., furnished, March 23, 1880, with a statement showing the monthly rain-fall at the following places, viz: Augusta, Ga., September, 1871, to March, 1880; Atlanta, Ga., October, 1878, to March, 1880; Charleston, S. C., September, 1871, to March, 1880; Corsicana, Tex., October, 1874, to March, 1880; Galveston, Tex., September, 1871, to March, 1880; Indianola, Tex., May, 1872, to March, 1880; Little Rock, Ark., July, 1879, to March, 1880; Memphis, Tenn., September, 1871, to March, 1880; Mobile, Ala., September, 1871, to March, 1880; Montgomery, Ala., October, 1872, to March, 1880; Nashville, Tenn., January, 1871, to March, 1880; New Orleans, La., September, 1871, to March, 1880; Savannah, Ga., September, 1871, to March, 1880; Shreveport, La., November, 1871, to March, 1880, Vicksburgh, Miss., September, 1871, to March, 1880.

Mr. E. W. Huntington, attorney at law, New Orleans, La., furnished, April 1, 1880, with a statement showing the direction and velocity of the wind and the state of the weather at Galveston and Indianola, Tex., at each observation from September 16, 1875, to November 13, 1875.

Mr. W. E. Smith, superintendent Memphis and Little Rock Railroad Company, Memphis, Tenn., furnished, April 2, 1880, with a statement showing the dates of highest and lowest water in the Mississippi River at Cairo, Ill., during the months of April, May and June, 1874, and in the Tennessee River at Chattanooga, Tenn., from September 19, 1875, to March 27, 1880.

Mr. H. S. Holden, Syracuse, N. Y., furnished, April 2, 1880, with a statement showing the total movement and maximum hourly velocity of the wind, in miles, at Buffalo, Rochester, Oswego, Albany and New York City, N. Y., for each month of the year 1879.

Mr. Maxwell Hall, meteorological observatory, Montego Bay, Jamaica, W. I., furnished, April 14, 1880, with a statement showing the annual mean barometer and thermometer, rain-fall, and prevailing wind from 1872 to 1879, inclusive; and the annual mean maximum and minimum temperatures, mean relative humidity, and maximum velocity of wind from 1874 to 1879, inclusive, at Punta Rassa and Key West, Fla.

Mr. H. C. Clagett, attorney at law, Washington, D. C., furnished, April 14, 1880, with a statement showing the kind and amount of clouds, the state of the weather, and the rain-fall at the several observations on February 27, 1880, at Washington, D. C.

Mr. Crosby Gray, health officer, Pittsburgh, Pa., furnished, April 20, 1880, with a statement showing the stage of the water in the Monongahela River at Brownsville, Pa., and Morgantown, W. Va., during the months of February and March, 1880; also the state of the weather at the latter place for the same period.

Mr. M. H. Clark, Clarksville, Tenn., furnished, April 21, 1880, with a statement showing the mean barometer, mean temperature, and total amount of rain-fall during the months of June to December, 1876, inclusive; January and February, 1877; October, 1878, and September and October, 1879, at Nashville, Tenn.

Dr. C. J. Kenworthy, Jacksonville, Fla., furnished, April 22, 1880, with a statement showing the mean relative humidity for November and December, 1875; November, December, January, February and March, 1876, '77, '78, '79, and January, February, and March, 1880; mean for the five months named, and the mean for calendar years ending December 31, 1875, '76, '77, '78 and '79, at Atlantic City, N. J.; Breckenridge, Duluth and Saint Paul, Minn.; Augusta, Ga.; Punta Rassa and Key West, Fla., and Denver, Colo.

George F. Gunther, tobacco broker, Louisville, Ky., furnished, May 4, 1880, with a statement showing maximum, minimum, and mean temperatures and total rain-fall for each month from January, 1873, to March, 1880, inclusive, at Cincinnati, Ohio and Nashville, Tenn.

Mr. L. Bell, city counselor, Saint Louis, Mo., furnished, May 15, 1880, with a statement showing the velocity of the wind at Saint Louis, Mo., at 9 and 10.42 p. m. (local time), on March 30, 1872.

Messrs. Mather, Foard & Co., ship and steamboat agents and brokers, 54 South Gay street, Baltimore, Md., furnished, May 31, 1880, with a statement showing the state of weather, direction and velocity of wind, and character and direction of ocean swell at Cape Henry, Va., at each observation from 7 a. m., May 9, to 11.04 a. m., May 11, 1880. Also, extract from Abstract of Journal for May 9, 10 and 11, 1880.

Mr. H. C. Warinner, attorney at law, 38 Madison street, Memphis, Tenn., furnished, June 12, 1880, with a statement showing the state of weather, the beginning, ending and amount of rain-fall at Memphis, Tenn., during the months of November and December, 1875.

Mr. S. C. Busey, 1525 I street, N. W., Washington, D. C., furnished, June 12, 1880, with a statement showing the periods in the months of June, July, August and September of the years 1876, 1877, 1878 and 1879, during which the temperature of the air rose 10° or more above the July normal at Baltimore, Md., Chicago, Ill., New York City, N. Y., and Washington, D. C. Also showing the mean temperature, mean relative humidity and total rain-fall for each day during the specified periods.

Mr. Robert A. Caskie, Rocheport, Boone County, Mo., furnished, June 15, 1880, with a statement showing the amount of snow-fall at Boise City, Idaho; Denver, Colo.; Salt Lake City, Utah and Santa Fé, N. Mex., during December, 1879, and January, February, March and April, 1880.

General M. C. Meigs, Quartermaster-General, U. S. A., furnished, June 21, 1880, with a statement showing the mean daily barometer and thermometer at Washington, D. C., from January 1 to June 1, 1880.

Hon. Commissioner of Agriculture, furnished, June 25, 1880, with a statement showing the average preciptiation for the months of March, April and May, and the actual amount for the same months of 1879 and 1880; the average precipitation for the months of July, August, September and November, with the actual amount for same months of 1878 and 1879; also the average mean temperature of December, January and February, with the mean for the same months during the winters of 1878–'79 and 1879–'80 at Baltimore, Md., Chattanooga, Tenn., Charlotte, N. C., Cairo, Ill., New London, Conn., New York, N. Y., Norfolk, Va., Philadelphia, Pa., Saint Louis, Mo., and Washington, D. C.

Maj. C. B. Comstock, Corps of Engineers, U. S. A., Detroit, Mich., furnished weekly during the year with a report of the stage of water in rivers at following stations:

REGULAR STATIONS.

Cairo, Ill.,
Cincinnati, Ohio.
Davenport, Iowa.
Dubuque, Iowa.
Keokuk, Iowa.
La Crosse, Wis.
Leavenworth, Kans.
Louisville, Ky.
Memphis, Tenn.
New Orleans, La.
Omaha, Nebr.
Pittsburgh, Pa.
Shreveport, La.
Saint Louis, Mo.
Saint Paul, Minn.
Vicksburg, Miss.
Yankton, Dak.

SPECIAL STATIONS.

Booneville, Mo.
Brunswick, Mo.
Evansville, Ind.
Helena, Ark.
Hermann, Mo.
Jefferson City, Mo.
Kansas City, Mo.
Le Claire, Iowa.
Lexington, Mo.
Little Rock, Ark.
Marietta, Ohio.
Paducah, Ky.
Plattsmouth, Mo.
Saint Joseph, Mo.
Warsaw, Ill.

Capt. M. R. Brown, Corps of Engineers, U. S. A., Port Eads, South Pass, La., furnished weekly during the year with a report of the stage of water in river at the following stations: Cairo, Ill., Cincinnati, Ohio, Keokuk, Iowa, Leavenworth, Kans., Little Rock, Ark., Louisville, Ky., Nashville, Tenn., New Orleans, La., Pittsburgh, Pa., Shreveport, La., Saint Louis, Mo., Vicksburg, Miss., and Yankton, Dak.

Health officer, Washington, D. C., furnished monthly during the year with an abstract of the meteorological observations made at the office of the Chief Signal Officer, Washington, D. C.

New Jersey State board of health, Metuchen, N. J., furnished monthly during the year with an extract of the meteorological observations made at Cape May, N. J.

Michigan State board of health, Lansing, Mich., furnished monthly during the year with an abstract of the meteorological observations made at Grand Haven, Marquette, Alpena, Detroit, Escanaba and Port Huron, Mich.

Cotton exchanges at Memphis and Nashville, Tenn., Saint Louis, Mo., and Boston, Mass., furnished weekly during the year with the daily and total rain-fall of the week at Augusta, Ga.; Baltimore, Md.; Cedar Keys, Fla.; Charleston, S. C.; Cincinnati, Ohio; Corsicana, Denison, Galveston, Indianola and San Antonio, Tex.; Fort Gibson, Ind. T.; Jacksonville, Fla.; Knoxville, Memphis and Nashville, Tenn.; Little Rock, Ark.; Louisville, Ky.; Lynchburgh and Norfolk, Va.; Mobile and Montgomery, Ala.; New Orleans and Shreveport, La.; Savannah, Ga.; Vicksburg, Miss.; and Wilmington, N. C.

Messrs. W. B. Dana & Co., New York City, furnished monthly during the year with a report of the rain-fall, number of days on which rain fell, and highest and lowest and average temperature at Augusta and Savannah, Ga.; Cedar Keys and Jacksonville, Fla.; Charleston, S. C.; Corsicana, Galveston and Indianola, Tex.; Memphis and Nashville, Tenn.; Mobile and Montgomery, Ala.; New Orleans and Shreveport, La.; Norfolk, Va.; Vicksburg, Miss.; and Wilmington, N. C.

PAPER 8.

List of publications received during the fiscal year ending June 30, 1880.

Eighth, ninth and tenth annual reports of the Geological Survey of Indiana, made during the years 1876-'77-'78. By E. T. Cox, State geologist. Indianapolis, 1879.

Port charges and requirements on vessels in the various ports of the world, with tables of moneys, weights and measures of all nations. By Theodore Hunter and Jarvis Patten. Parts 1 and 2. New York, 1879-'80.

Meteorological observations made at the U. S. Naval Observatory during the year 1876. Washington, 1879.

Ordnance Notes (Nos. 102, 105 to 108 and 110 to 125 inclusive), Ordnance Office, War Department, Washington, 1879-'80.

Proceedings of the Louisiana State Medical Association, held in the city of New Orleans, April, 1879.

A general index of the Agricultural Reports of the Patent Office, for twenty-five years, from 1837 to 1861, and the Department of Agriculture for fifteen years, from 1862 to 1876. By the Commissioner of Agriculture. Washington, 1879.

Bulletin of the United States National Museum, Contributions to the Natural History of Arctic America, made in connection with the Howgate Polar Expedition, 1877-'78. By Ludwig Kumlieu.

International Monetary Conference held in compliance with the invitation extended to certain governments of Europe by the Government of the United States in Paris in August, 1878.

Catalogue of Scientific Serials of all countries, including the transactions of learned societies in the natural, physical and mathematical sciences, 1633-1876. By S. H. Scudder. Cambridge, 1879.

(Department of Agriculture—Special Report No. 12.) Investigation of diseases of swine and infectious and contagious diseases incident to other domesticated animals. Washington, 1879.

Reports to the Saint Louis Medical Society on Yellow Fever. By W. Huston Ford, M. D.

Report on the Russian Army and its Campaigns in Turkey in 1877-'78. By Lieut. F. V. Greene, U. S. Army.

Annals of the Astronomical Observatory of Harvard College. Vol. XI.—Part I. Photometric observations during the years 1877-'79. By Edward C. Pickering. Harvard, 1879.

Report of the Commissioner of Education for the year 1877. Washington, 1879.

The Statutes at Large of the United States of America from October, 1877, to March, 1879, Vol. XX. Washington, 1879.

"Mathematics in a Dilemma." New York, 1879.

Protection to Forests a Necessity. By S. V. Dorrien. New York, 1879.
Annual report of the Operations of the United States Life-Saving Service for the fiscal year ending June 30, 1878.
Abridgment of the Nautical Almanac and Tide Tables 1880, published by John Bliss & Co.
Annual report of the Secretary of War for the year 1879.
Annual report of the General of the Army to the Secretary of War for the year 1879.
Tea culture as a probable American industry. By William Saunders. Washington, 1879.
Annual report of the Inspector-General of the Army to the Secretary of War for the year 1879.
Annual report of the Commissioner of Agriculture for the year 1878. Washington, 1879.
Annual report of the Surgeon-General, U. S. Army, for the year 1879.
Annual report of the Third Auditor of the Treasury for the year 1879.
Annual report of the Secretary of the Navy for the year 1879.
Annual report of the Secretary of the Interior for the year 1879.
Annual report of the Postmaster-General of the United States for the year 1879.
Annual report of the Director of the Mint for the year 1879.
Annual report of the Commissioner of Internal Revenue for the year 1879.
Report of the director of the New York, Meteorological Observatory, Department of Public Parks, city of New York for the years 1876 and 1878.
Annual report of the Treasurer of the United States for the year 1879.
Annual report of the Auditor of Railroad Accounts made to the Secretary of the Interior for the year ending June 30, 1879.
On the Coincidence of the Bright Lines of the Oxygen Spectrum with Bright Lines in the Solar Spectrum. By Henry Draper, M. D.
A unit of eight grammes, proposed by Robert Noxon Tappan. (International Coinage.)
Report of the Observations of the total Solar eclipse July 29, 1878, made at Fort Worth, Texas. Edited by Leonard Waldo, Cambridge, 1879.
United States Northern Boundary Commission: Declination of Fixed Stars. By Assistant Lewis Boss.
Annual report of the Quartermaster-General to the Secretary of War for the year 1879.
Annual report of the Director of the Astronomical Observatory of Harvard College for 1879 Cambridge, 1880.
Annual report of the Chief of Ordnance to the Secretary of War for the fiscal year ending June 30, 1879.
Thirty-first annual report of the Cincinnati Chamber of Commerce and Merchants' Exchange for the year ending August 31, 1879.
Catalogue of the Library of the United States Naval Observatory, Washington. Part I: Astronomical Bibliography. By Prof. E. S. Holden, U. S. N. Washington, 1879.
Contributions to Meteorology. By Prof. E. Loomis. (Twelfth paper.)
Bulletin of the United States Geological and Geographical Survey of the Territories, Vol. V, No. 3. Washington, 1879.
The tornado of April 14, 1879. By J. L. R. Wadsworth, M. D. and Francis E. Nipher.
Annals of the Astronomical Observatory of Harvard College, Vol. XI, Part II. Cambridge, 1879.
Proceedings and report of the Board of Army Officers, convened by Special Orders No. 78, Headquarters of the Army, Adjutant-General's Office, Washington, April 12, 1878, in the case of Fitz-John Porter. 3 vols. Washington, 1879.
Annual report of the Light-House Board to the Secretary of the Treasury for the year ending June 30, 1879.
Annual statement of the trade and commerce of Saint Louis for the year 1879, reported to the Merchants' Exchange of Saint Louis. By George H. Morgan, secretary. Saint Louis, 1880.
Report on Magnetic Determinations in Missouri, summer of 1879. By Prof. Francis E. Nipher.
Studies in relation to the production of pain by weather. By J. T. Everett, M. D. Chicago, 1879.
(Bulletin No. 3.) The Cotton Worm—Summary of its natural history, with an account of its enemies, and the best means of controlling it; being a report of progress of the work of the commission. By Chas. V. Riley, M. A.
Official Army Register, January, 1880.
A historical sketch of Henry's contribution to the electro-magnetic telegraph, with an account of the origin and development of Professor Morse's invention. By William B. Taylor. Washington, 1879.
Annual report of the Comptroller of the Currency to the second session of the Forty-sixth Congress of the United States, December 1, 1879.

Memorials, reports and statistics concerning improvements of New Haven Harbor. New Haven, 1879.

List of light-houses, lighted beacons and floating lights on the Atlantic, Gulf and Pacific coasts of the United States, corrected to January 1, 1880. Washington, 1880.

Report on the methods of surveying the public domain to the Secretary of the Interior, at the request of the National Academy of Sciences. By J. W. Powell, 1878.

Annual report of the Commissary-General of Subsistence to the Secretary of War for the year 1879.

Annual report of the Judge-Advocate-General of the Army to the Secretary of War for the year 1879.

Fourth annual report of the Johns Hopkins University. Baltimore, 1879.

Geological survey of the State of New Jersey. Annual report of the State geologist for the year 1878.

United States Coast and Geodetic Survey. Methods and results, secular change of magnetic declination in the United States and at some foreign stations. Washington, 1879.

Methods and results on a chart of the magnetic declination in the United States. Appendix No. 21, report of 1876. Washington, 1879.

Seventeenth annual report of the Secretary of the State Board of Agriculture of the State of Michigan for 1878. Lansing, 1878.

Transactions of the Connecticut Academy of Arts and Sciences, Vol. V, Part I. New Haven, 1880.

Rules for conducting business in the House of Representatives of the United States. Washington, 1880.

Circulars of Information of the Bureau of Education No. 5, 1879. American Education as described by the French Commission to the International Exhibition of 1876. Washington, 1879.

Subject index to the publications of the United States Naval Observatory, 1843–1875. By Edward S. Holden. Washington, 1879.

Annual report of the Board of Health of the State of Louisiana for the year 1879. New Orleans, 1880.

Thirteenth annual report of the Health Department of the Common Council of the City of Cincinnati for the year 1879. Cincinnati, 1880.

The Ordnance Department as a portion of the United States Military Establishment, being a historical statement of the rise and progress of the Ordnance Department, and a consideration of the legal relations of the Department to the Secretary of War and Army proper. Washington, 1876.

Official Gazette of the United States Patent Office, Vol. XVI, July 1 to December 30, inclusive, 1879. Washington, 1880.

Annual report of the Corporation of the Chamber of Commerce of the State of New York for the year 1879–'80. New York, 1880.

Papers relating to the Foreign Relations of the United States, transmitted to Congress, with the Annual Message of the President, December 1, 1879. Washington, 1879.

Transactions of the Academy of Science of Saint Louis, Vol. IV, No. I. Saint Louis, 1880.

Circular of information of the Bureau of Education, No. 1, 1880. College libraries as aids to instruction. Washington, 1880.

Address of Prof. Samuel P. Langley, vice-president, Section A, before the American Association for the Advancement of Science, at the Saratoga meeting, August, 1879. Salem, 1879.

Short memoirs on Meteorological Subjects, translated by Cleveland Abbe, reprinted from the Smithsonian Report for 1877. Washington, 1878.

Annual Report and Statistics of the Meteorology and Mortality of the city of Oakland, Cal., for the year 1879. By J. B. Trembley, M. D. San Francisco, 1880.

American inventions and improvements in breech-loading small-arms, heavy ordnance, &c. Compiled by Charles B. Norton, Brevet Brig. Gen., U. S. V.

Methods, discussions and results. Notes on measurements of terrestrial magnetism. Second edition. United States Coast Survey. Washington, 1877.

Results of Rain Observations made in New South Wales during 1878. By H. C. Russell. Sydney, 1879.

Description of Pattern C Heliostat. By Elphinstone Begbie.

Journal of the Scottish Meteorological Society, Nos. LVII, LVIII, LIX.

Daily Weather Reports, Meteorological Office, London, 1st July to 31st December, 1878, and 1st January to 30th June, 1879.

Symons's Monthly Meteorological Magazine. June, 1879, to May, 1880.

Natural History Journal, conducted by the Societies in Friends Schools. May 15, 1879, to May 15, 1880.

Quarterly Journal of the Meteorological Society. London, April, July and October, 1879, and January, 1880.

Forty-sixth Annual Report of the Royal Cornwall Polytechnic Society, 1878.

Papers and proceedings and report of the Royal Society of Tasmania, for 1877. Tasmania, 1878.

Report on the Rainfall of the N. W. Provinces and Oudh. By S. A. Hill. Allahabad, 1879.

Report of the proceedings of the Second International Meteorological Congress at Rome, 1879. Published by autority of the Meteorological Council. London, 1879.

Contributions to the Meteorology of the Pacific, No. 3. Samoan or Navigators Islands. By Robert H. Scott, M. A.

Contributions to our knowledge of the Meteorology of the Arctic Regions. Published by authority of the Meteorological Council. Part 1. London, 1879.

Report on the Madras Cyclone of May, 1877. By John Eliot, M. A. Calcutta, 1879.

Report on the Meteorology of India in 1877. By John Eliot, M. A. Calcutta, 1879.

Report on the Administration of the Meteorological Department of the Government of India in 1877–'78, and 1878–'79.

Report on the Meteorology of the Kerguelen Island. By Rev. S. J. Perry, S. J. Published by the authority of the Meteorological Council (Official No. 37).

The Solar Spectrum in 1877 and 1878, with some practical idea of its probable temperature of origination. By Piazza Smyth, F. R. S. E. Edinburgh, 1879.

Annual Report of the Kew Committee, for the year ending October 31, 1879.

Report of the Meteorological Council to the Royal Society, for the year ending 31st March, 1879. London, 1880.

Results of Observations in Meteorology, Terrestrial Magnetism, &c., &c., taken at the Melbourne Observatory during the year 1876, under the superintendence of Robt. L. J. Ellery, F. R. S. Vol. V.

Astronomical and Magnetical and Meteorological Observations made at the Royal Observatory, Greenwich, in the year 1877. London, 1879.

Results of Astronomical Observations made at the Royal Observatory, Greenwich, 1877.

Results of the Magnetical and Meteorological Observations made at the Royal Observatory, Greenwich, in the year 1877. London, 1879.

Results of Astronomical Observations made at the Royal Observatory, Cape of Good Hope, during the year 1876. Cape Town, 1879.

Cape of Good Hope.—Report of the Meteorological Commission for the year 1878. Cape Town, 1879.

Weekly results of Meteorological Observations taken at Silloth Rectory, Cumberland, in the year 1879. By the Rev. Francis Redford, M. A.

On the comparison of the standard barometers of the Royal Observatory, Greenwich, and the Kew Observatory. By G. M. Whipple.

Account of the Operations of the Great Trigonometrical Survey of India. Vols. II to V. By Col. J. T. Walker. Calcutta, 1879.

Indian Meteorological Memoirs; being occasional discussions and compilations of meteorological data relating to India and neighbouring countries, under the direction of Henry F. Blanford. Vol. I, Part III.

Journal and Proceedings of the Royal Society of New South Wales, 1878. Vol. XII. Sydney, 1879.

Thermometer exposure, Wall *versus* Stevenson Screens. By William Marriott.

Reduction of Meteorological Observations. By William Marriott.

Twelfth annual report of the Department of Marine and Fisheries, being for the fiscal year ended June 30, 1879. Ottawa, 1880.

Report on the Meteorological Service of the Dominion of Canada. By G. T. Kingston, M. A., for the year ending December 31, 1878.

Sur les dernières crues de la Seine. Par MM. L. Lalanne et G. Lemoine.

Ponts et Chaussées, Service Hydrométrique du Bassin de la Seine.

Résumé des Observations Centralisées pendant l'année 1877 et 1878. Par MM. L. Lalanne et G. Lemoine. Versailles 1879–'80.

Observations sur les cours d'eau et la pluie centralisées pendant l'année 1877 et 1878. Par MM. Belgrand et G. Lemoine.

Annales du Bureau Central Météorologique de France. Année 1878. Paris, 1879.

Annuaire de l'Observatoire de Montsouris pour l'an 1880.

Algérie. Météorologie. (Extrait de la Statistique générale de l'Algérie pour les années 1876 à 1878.) Paris, 1879.,

Rapport lu le 4 novembre 1879, à la première séance générale du conseil du Bureau Central, par le Président, conformément à l'Article 13 du décret du 14 mai 1878.

Des conditions climatologiques des années 1869 à 1879 en Normandie, et de leur influence sur la maturation des récoltes. Par M. Hervé Mangon.

Commission météorologique du département de Vaucluse, Compte-Rendu pour l'année 1878.

Résumé des Observations météorologiques faites á l'École normale d'Avignon pendant l'année agricole 1878–'79. Par M. Giraud. Avignon, 1879.

Système des quatre vents simultanés (Polaires et Équatoriaux derivé d'un principe de l'Orore physique de la nature, découvert par L. Purper.

Zeitschrift der österreichischen Gesellschaft für Meteorologie. Von Dr. J. Hann. XIII. und XIV. Band. Wien, 1878–79.

Jahrbücher der k. k. Central-Anstalt für Meteorologie und Erdmagnetismus. Jahrgang 1876 und 1877, XIII. und XIV. Band. Wien, 1877 und 1880.

PAPER 9.

Monthly and annual mean barometer, corrected for temperature and instrumental error only (deduced from the three telegraphic observations), from July, 1879, to June, 1880, inclusive.

[The daily means are obtained by dividing the sum of the three telegraphic observations by three; the monthly means by dividing the sum of the daily means by the number of days in the month.]

Station.	Elevation of cistern of barometer above mean sea-level.	1879.						1880.						Annual mean.
		July.	August.	September.	October.	November.	December.	January.	February.	March.	April.	May.	June.

a Station closed June 19, 1880.
b Nineteen days only.
c Twenty-eight days only.
d Observations commenced October 27, 1879.
e Twenty-one days only.
f Twenty-nine days only.
g Twenty-three days only.
h Twenty-five days only.
i Twenty-two days only.
Barometer unserviceable.
k Fifteen days only.
l Station closed October 30, 1879.
m Twenty-seven days only.
n Eighteen days only.
o Twenty-four days only.

PAPER 10.

Mean normal barometer, deduced from the three telegraphic observations (corrected for temperature and instrumental error only), from January 1, 1873, to December 31, 1879, except for stations opened subsequent to the former date.

[The daily means are obtained by dividing the sum of the three telegraphic observations by three; the monthly means by dividing the sum of the daily means by the number of days in the month.]

PAPER 11.

Monthly and annual mean pressure, reduced to sea-level, from observations taken at 7 a. m., 2 p. m., and 9 p. m. (local time), from July, 1879, to June, 1880, inclusive.

[The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m., and twice the 9 p. m. observations by four; the monthly means by dividing the sum of the daily means by the number of days in the month.]

Station.	Elevation of cistern of barometer above mean sea-level.	1879.						1880.						Annual mean.

PAPER 12.

Annual and mean annual pressures, reduced to sea-level, at stations of the Signal Service, United States Army, in operation June 30, 1880, deduced from observations taken at 7 a. m., 2 p. m., and 9 p. m., local time.

[The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m., and twice the 9 p. m. observations by four; the monthly means by divining the sum of the daily means by the number of days in the month.]

PAPER 13.

Monthly and annual mean temperature, July, 1879, *to June,* 1880, *inclusive, deduced from observations taken at* 7 *a. m.,* 2 *p. m., and* 9 *p. m.* (*local time*).

[The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m., and twice the 9 p. m. observations by four; the monthly means by dividing the sum of the daily means by the number of days in the month.]

Stations.	Elevation of thermometer above ground.	1879.						1880.						Annual mean.

PAPER 14.

Annual and mean annual temperature at stations of observation of the Signal Service, United States Army, in operation on June 30, 1880, *deduced from observations taken at 7 a. m., 2 p. m., and 9 p. m., local time.*

[The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m., and twice the 9 p. m. observations by four; the monthly means by dividing the daily means by the number of days in the month.]

PAPER 15.

Monthly and annual mean relative humidity; from observations taken at 7 a. m., 2 p. m., and 9 p. m. (local time), July, 1879, to June, 1880, inclusive.

[The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m., and 9 p. m. observations by three; the monthly means by dividing the sum of the daily means by the number of days in the months.]

Range	37°		42°		52°		56°		61°		64°		45°		68°		57°		47°		56°		39°	
Monthly mean	71°.2		68°.0		59°.8		56°.1		37°.5		28°.4		31°.0		28°.6		32°.9		49.8		66°.4		71°.9	

Elevation of thermometers above ground, 51 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 54 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 5 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

*Observations commenced November 16, 1879.

Elevation of thermometers above ground, 20 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

*Observations commenced March 16, 1880.

Elevation of thermometers above ground, 29 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

STATION, CINCINNATI, OHIO.

Elevation of thermometers above ground, 52 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

* Thermometers destroyed by fire September 26, 1879.

† Thermometers broken.

‡ Minimum thermometer broken.

Elevation of thermometers above ground, 16 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month. Observations incomplete.

Maximum, minimum and mean temperatures—Continued.

* Monthly mean of local observations.

Elevation of thermometers above ground, 17 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 a. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	45°		52°		64°		47°		42°		45°	
Monthly mean	25°.8		19°.9		22°.6		37°.1		55°		63°.7	

Elevation of thermometers above ground, 25 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 36 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m., and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	32°		36°		46°		49°		53°		52°		45°		49°		50°		42°		43°		33°	
Monthly mean	72°.9		68°.5		58°.2		57°.8		39°.4		28°.9		37°.3		32°.2		34°.2		44°.8		61°.2		67°	

Elevation of thermometers above ground, 23 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 47 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 46 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	34°		33°		32°		44°		56°		45°		36°		47°		49°		51°		48°		43°	
Monthly mean	76°.4		75°.5		70°.0		66°.7		52°.4		53°.5		50°.4		49°.5		50°.0		57°.9		66°.1		74°.1	

Elevation of thermometers above ground, 4 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

STATION, KNOXVILLE, TENN.

Elevation of thermometers above ground, 34 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	38°		42°		46°		56°		58°		69°		46°		53°		43°		53°		47°		42°	
Monthly mean	71°.8		69°.4		58°.6		55°.6		30°.8		23°.5		34°.7		28°.6		33°.0		44°.9		61°.5		67°.8	

Elevation of thermometers above ground, 105 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Monthly mean	82°.4		77°.6		73°.8		68°.1		58°.6		54°.4		58°.0		54°.2		62°.0		67°.5		76°.7		80°.1	

Elevation of thermometers above ground, 34 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 28 feet (below summit of Mount Washington).

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 a. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 28 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

* Highest observed temperature; maximum thermometer out of order.

Elevation of thermometers above ground, 19 feet.

The daily means are obtained by dividing the sum of the 7 p. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	37°		40°		53°		55°		54°		65°		42°		59°		48°		47°		52°		40°	
Monthly mean	70°.6		67°.6		59°.2		57°.3		40°.4		32°.4		36°.2		31°.9		32°.8		45°.7		61°.9		67°.0	

Elevation of thermometers above ground, 35 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 5 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

* Thermometer unserviceable.

Elevation of thermometers above ground, 5 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 80 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 45 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	22°		20°		19°		26°		38°		24°		27°		27°		35°		33°		25°		26°	
Monthly mean	81°.2		81°.3		79°.3		77°.0		69°.5		70°.4		68°.3		68°.6		73°.0		74°.2		76°.1		80°.1	

Elevation of thermometers above ground, 14 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 20 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 48 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

* Minimum thermometer unserviceable.

Elevation of thermometers above ground, 4 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	43°.5		40°.0		45°.5		59°		56°		65°		40°.5		54°		48°		51°		42°		38°.5	
Monthly mean	81°.6		74°.7		60°.9		61°.9		44°.7		31°.7		43°.8		38°.2		42°.3		56°.8		68°.6		74°.4	

Elevation of thermometers above ground, 39 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Range	38°		44°		42°		70°		51°		79°		60°		77°		69°		57°		51°		41°	
Monthly mean	73°.5		70°.2		57°.1		57°.2		32°.6		11°.9		26°.1		20°.9		29°.2		45°.2		63°.1		68°.0	

Elevation of thermometers above ground, 32 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 7 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

* Record incomplete.

Elevation of thermometers above ground, 7 feet.

The daily means are obtained by dividing the sum of the 7 a.m., 2 p.m. and *twice* the 9 p.m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 6 feet.

The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

Maximum, minimum and mean temperatures—Continued.

Elevation of thermometers above ground, 5 feet.
The daily means are obtained by dividing the sum of the 7 a. m., 2 p. m. and *twice* the 9 p. m. observations by *four*. The monthly means are obtained by dividing the sum of the daily means by the number of days in the month.

PAPER 19.

Statement showing how many times the wind was observed blowing from the eight principal points of the compass during each month and season of the year ending June 30, 1880. Compiled from observations taken at the several stations of observations at 7 a. m., 2 p. m. and 9 p. m. (local time).

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL-OFFICER,

DIVISION OF TELEGRAMS AND REPORTS FOR THE BENEFIT OF COMMERCE AND AGRICULTURE.

Inspection report of ———, *made on station at* ———, *on* ———.

Comparative readings of barometer and thermometers at ———. *Corrected for an elevation of* ——— *feet.*

Date.	Inspector's barometer No. ———. Instrumental error, ———.			Station barometer No. ———. Instrumental error, ———.			Extra barometer No. ———. Instrumental error, ———.			Aneroid barometer No. ———.	Aneroid barometer No. ———, corrected.	Station thermometer No. ———.	Extra thermometer.	Dry bulb.
	Attached thermometer.	Observed reading.	Corrected reading.	Attached thermometer.	Observed reading.	Corrected reading.	Attached. thermometer.	Observed reading.	Corrected reading.					

Station barometer No. —— reads —— than inspector's barometer No. ——.
Extra barometer No. —— reads —— than inspector's barometer No. ——.

——— ———, *Inspector.*

RULES FOR THE GUIDANCE OF INSPECTING OFFICERS OF THE SIGNAL SERVICE, UNITED STATES ARMY.

1. The outfit of an inspecting officer will consist of the following-named instruments, in addition to the necessary blanks, stationery, &c.:

One standard mercurial barometer.
One standard aneroid barometer.
One standard thermometer.
One standard compass.

2. Upon arriving at a station he will carefully compare all station instruments with his standards, making not less than thirty readings of each instrument, and keeping an accurate record of the observations of both his own and the station instruments, and forwarding the same to the Chief Signal-Officer with his inspection report.

3. He will determine by the aid of his compass the accuracy with which the station wind-vane is placed in position upon the true meridian, and, if an error is found, will have it corrected before he leaves the station.

4. He will ascertain by actual measurement whether any change has been made in the elevation of the barometer, thermometer, or rain-gauge since the station was last inspected, and if such change has been made, will report the amount and date of the same.

5. In the event of any change having been made in the location of the office since the date of the last report, he will ascertain the exact elevation of the new office and of the several instruments above the bench-mark of the station, as given in circular No. 2, issued from the office of the Chief Signal-Officer under date of January 11, 1873, and is authorized to employ for this purpose, whenever necessary, the city engineer, or, in his absence, any other responsible person.

6. He will note carefully the condition of the office room or rooms, and when they are found improperly kept or arranged will see that the proper changes are made before he leaves the station.

7. He will examine in detail the office books from the date of the last previous inspection, and if errors are found, will point them out and instruct the observer in charge how to correct them. In case of omission on the part of the observer in charge to keep all or part of any record, he will report the fact to the Chief Signal Officer, with such recommendations as he thinks proper, accompanying the report with a written statement from the observer of the cause of said omission.

8. The condition of the several instruments will be thoroughly examined, and when any fault of location or want of cleanliness is discovered, will attend in person to its correction. The observer will be examined as to his knowledge of the instruments and their management in detail, and when found ignorant of any part will be properly instructed.

9. All map and bulletin frames will be personally inspected and their condition noted from actual observation, and not from the observer's statement. The date of the several maps and bulletins posted in the frames at the time of inspection will be observed, and if the latest issue is not found therein the observer will be called to account for neglect of duty.

10. A full list will be forwarded with each report of all maps and bulletins issued at the station inspected, showing the names and local address of each person, firm, or institution receiving them.

11. The chairman of the meteorological committee, or committees where more than one exist at a station, will be visited, and inquiry made as to the conduct of the observer and other men on duty at the station, and the manner in which they perform their special duties. Suggestions will be invited that tend to increase the usefulness of the service by a wider diffusion of the reports.

12. The amount and condition of the property for which the observer is responsible will be noted in the report, and suitable disposition of unserviceable property recommended.

13. The observer in charge will be examined as to his knowledge of the various circulars from the central office, and when he does not appear to understand any one or part of one, proper instructions will be given him.

14. The inspector will explain to each observer the proper manner of furnishing items of special interest in the reports to the local newspapers, impressing upon them at all times, however, the fact that these items will not be furnished when the papers can be induced to print full reports.

15. The inspection report of each station must be made out and mailed before the inspecting officer leaves the station.

16. The inspector will be present in person at all the observations made at the station he is inspecting during some one day of his inspection, and will correct on the spot any errors into which the observer may have fallen.

17. He will examine the assistants on duty at the station as to their knowledge of their practical duties, and also as to the progress made by them in the theoretical

knowledge of meteorology, and will report the result of such examination to the Chief Signal Officer.

18. When any instrument or other item of public property is found unserviceable at a station, the inspector will state whether or not it is necessary that it should be replaced.

19. When the removal of an office is recommended by an inspector, the location and rental of the proposed office will be given, and also a careful estimate of the cost of removal.

20. The official numbers of all instruments will be given in each inspection report.

21. If the inspector finds it necessary to change instruments on any station, the fact, as well as the numbers of the instruments exchanged, will be reported.

WAR DEPARTMENT,

OFFICE OF THE CHIEF SIGNAL OFFICER,

DIVISION OF TELEGRAMS AND REPORTS FOR THE BENEFIT OF COMMERCE AND AGRICULTURE.

INSPECTION REPORT.

Diagram of office, giving dimensions, number and location of doors and windows. Positions of instruments to be marked.	Name and number of street on which office is situated. GENERAL REMARKS AND SUGGESTIONS.

———— ————, *A. S. O. and Inspector.*

Date, ———

Station, ———.

PAPER 22.

Extracts from the instructions to observer sergeants.

* * * * * * *

6. The regular observations from ——— will commence with the morning observation of ———, and on and after that date eight observations will be made daily, three of which will form the *telegraphic*, three the *local*, and one the *midday*, and one the *sunset* series. These observations will be recorded in the "Original Record of Observations" and the "Daily Record of Observations," a separate sheet being used in the Daily Record of Observations for each series.

7. The observations forming the telegraphic series will be taken daily at — a. m., — p. m., and — p. m., local time (corresponding with 7 a. m., 3 p. m., and 11 p. m. Washington mean time), and, after the proper corrections have been made, will be written on Form 5, if the station is a telegraphic one, and also in the Record of Bulletins (where this is authorized). The midday series of observations will be taken at — m., local time (corresponding with 11 a. m. Washington mean time), and those of the local series at 7 a. m., 2 p. m., and 9 p. m., respectively. The midday series will be entered in the Daily Record as a separate series. When this report is called for by telegraph from the central Office a full report will be sent, consisting of the corrected and actual barometric readings, temperature, humidity, direction of wind, and state of weather; velocity of wind, in miles, per hour; maximum velocity of wind, in miles, per hour since last telegraphic observation; upper clouds; lower clouds; and the reading of the maximum thermometer at the time of observation; the whole being sent in the order in which they are here named, and in the regular cypher words, the word to express the maximum velocity since last telegraphic report being taken from the column of words beginning with the letter I. Rainfall will not be sent at this report. In sending the maximum temperature at time of observation, the cypher words on page 32 of the cypher book will be used. At stations that do not report by telegraph, Form 5 will not be used. A reading of the barometer, *i. e.*, corrected for temperature and instrumental error only (actual barometer), will be taken and recorded daily at each station at the hour of sunset. Spaces will be ruled on the last leaf of the Original Record of Observations, and an additional column in the weekly Meteorological Record book, and on Form 4, local sheet, in the blank space headed "Remarks for recording these observations."

8. The instruments will be read in the following order:

1. Barometer.	3. Hygrometer.	5. Anemoscope.
2. Thermometer.	4. Anemometer.	6. Rain-gauge.

The minimum thermometer at the a. m. telegraphic observation and the maximum and minimum thermometers at the midnight telegraphic observation will be read after the exposed thermometer. After the instruments have been read the character of the clouds and state of weather will be noted.

9. The readings of the different instruments and character of clouds and state of weather must be entered in the Original Record of Observations as soon as made, and *not* copied in afterward from a slip of paper. Observers will habitually carry this book when making observations and enter the readings in *pencil*, as noted at the time. They will also enter the proper corrections, as indicated by the marginal references. Pen and ink must *not* be used for entering any observation or corection. In filling up that portion of the Original Record of Observations which comes under the head of "Weather," *local* time will be used.

* * * * * * *

27. At all stations ordered to make river reports, the depth of water will be observed at 1 o'clock (local time) each afternoon, and embodied in the next succeeding regular telegraphic report.

28. Whenever any sudden or unusual change occurs in the condition of the river, a special series of observations will be made, which will be reported in the usual manner at the next succeeding telegraphic reports. These special reports will be continued tri-daily (one at each telegraphic report) until the river resumes its normal condition, when they will be discontinued.

* * * * * * *

30. The observations for the morning and midnight special river reports will be made, if practicable, within an hour of the time of report.

Observers must exercise the utmost care in making and recording the river observations, in order that they may be relied upon as accurate by interested parties.

31. The amount of precipitation (rain and melted snow) will be measured and reported at each of the three telegraphic reports only. Should more than four (4) inches of rainfall be recorded, two (2) cipher words will be used in reporting it.

The observer at each station will note, each day, at the exact time of sunset, and for a time not to exceed thirty minutes after sunset, the character of the western sky and of the sunset, and will state this character at the time, in writing, as "Fair Weather Sunset," "Doubtful Sunset," or "Foul Weather Sunset." The term "Fair Weather Sunset" will express such condition of the sky, particularly the western, and such character of the sunset as is considered to indicate a clear day for the day ensuing. The term "Doubtful Sunset" will indicate that the conditions are such as to leave the mind of the observer in doubt as to what the sunset presages for the following day. The term "Foul Weather Sunset" indicates that the sun is wholly obscured by clouds, and the appearances indicate a rainy or stormy day for the day following. It will be frequently noticed at the time of sunset that the western sky, while exhibiting generally the characteristics of a fair-weather sunset, is tinged more or less and in different places with the colors yellow or green. It is important that these colors should be carefully noted. In some instances the sunset will be found a decidedly yellow sunset, that being the predominant color of the western sky. The color green is rarely the predominant color, but portions of the western sky will sometimes markedly exexhibit it. For purposes of observation and report, the sunsets so differently described are known as yellow sunsets or green sunsets. Care must be taken in reference to reporting yellow, and particularly in reporting green, sunsets. The observer is to be quite sure that he clearly sees "green," and enough of it to be worthy of report. Whenever green is reported, the retained copy of such report will have written upon it the extent of western sky-surface seen apparently so colored, as $\frac{1}{6}$, $\frac{1}{4}$, and so on. Yellow and green sunsets will be considered as fair-weather sunsets.

The observer will endeavor to note either "Fair Weather," or "Foul Weather," noting as few "Doubtful" as possible. It is considered that practice will be found to make this comparatively easy. The note made for each evening will, at sunset of *next* day, be noted in writing as "verified" or "not verified."

The sunset prediction will be the last entry in the Journal and Abstract for the day, and its verification, as determined by the weather from the hour of prediction up to sunset of the ensuing day, be entered on the same line with it. In making sunset predictions, only local observations will be used.

An additional word will be added to the "midnight" telegraphic report from the station when the character of the sunset is "Doubtful" or indicates "Foul Weather." If, however, after the cipher word for thermometer, and before humidity, no word is added, it will be understood at this Office that the station reports a "Fair Weather Sunset." If the station reports a "Doubtful Sunset," it will do so by adding after the cipher word for thermometer, and before that for humidity, the word "Doubt." If the report is "Foul Weather Sunset," it will add, in the same space, the word "Foul." If a yellow sunset, the word "Yellow" will be added in the same space. If a green sunset, the word "Vert" will be added in the same space.

1. A sunset prediction of one day is verified, or not verified, as the case may be, by the weather until sunset of the ensuing day.

2. The prediction "FOUL" or "FAIR" refers especially to rain, and does not refer, in any way, to amount or kind of clouds or fog.

3. The prediction "FOUL" means that the appearance of the sky indicates *rain*. If *any* rain equalling or exceeding one one-hundredth of an inch falls before sunset on the ensuing day, the prediction is verified; and if not, it is *not* verified.

4. FAIR means that the appearance of the sky does not indicate rain, and if no rain equalling or exceeding one one-hundredth of an inch falls, the prediction is verified; if *any rain* in excess of this amount does fall the prediction is *not verified.*

5. DOUBTFUL sunsets cannot be verfied.

In using the following table for determining the proper times for taking the sunset observation, the times opposite the dates will be used as follows, viz: The time opposite the first of each month will be used on all dates from the first until the tenth; the time opposite the eleventh will be used on all dates from the eleventh until the twentieth; the time opposite the twenty-first will be used on all dates from the twenty-first until the last of the month.

* * * * * * *

BAROMETER.

34. The barometers used on signal-stations of observations will in all cases be carefully compared with the standard at this Office before issue, and the correction to be applied for instrumental error sent with each when issued.

The two barometers at each station will be carefully compared on the last two days of each month, by the observer in charge making a series of comparative readings of not less than twenty in number, ten being made each day at hourly intervals, the result of which will be recorded, as soon as made, in the daily journal. These comparative readings must not be corrected for elevation, but for temperature and instrumental error only.

In this connection it must be borne in mind that the *correction* for instrumental error is the reverse of the instrumental error; that is, if the error of a barometer is plus (+), the instrument reads too high and an amount equal to the error must be subtracted in order to correct for the error; and vice versa when the error is minus (—).

No change of instrumental error will be made without direct authority from this Office.

35. The barometer will be suspended so that the top of the mercurial column will be about the height of the eye, near a window, in such a manner as to be lighted perfectly, without exposure either to the direct rays of the sun or to the currents of air which are always found at the window-casings and doors. To protect the instrument from external injuries from dust, and from the direct radiation of warm bodies or currents of air from the window, observers will fasten the wooden case in which it is carried firmly againt the wall in a vertical position. An opening large enough to admit the tube of the barometer will be cut in the upper end of the box, and directly above this, at the distance of one inch, a strong hook will be driven into the wall. This hook must be small enough to allow the barometer to swing freely upon it and to hang in a perfectly vertical position, and should extend two or three inches beyond the box, and upon it the instrument will be suspended. When not in use, the cover will be closed; but when an observation is to be taken, it will be opened, and the instrument drawn out on the hook, clear of the box, and in the full light of the window. After the observation is made the barometer will be slipped back into the box.

36. A reading of the barometer taken for telegraphic transmission will be corrected by the observer making the observation for *temperature*, for *instrumental* error, and for *elevation*, before they are sent from his station. In correcting for temperature, the reading of the *attached* thermometer will be used, while, in correcting for elevation, the temperature used will be that of the *exposed* or open-air thermometer.

In addition to the barometrical reading, reduced to sea-level, as above specified, the actual barometer reading (corrected for temperature and instrumental error only) will be reported from all stations equipped with mercurial barometers, and will be enciphered in the third space on Form 5.

In correcting for elevation, the height of the surface of the mercury in the cistern of the barometer above the ground must be added, in all cases, to the height of the station above sea-level, as in the following example, viz: Suppose height of station above sea-level to be 670 feet; height of mercury (surface) in cistern to be 27 feet above the ground; then the elevation to be corrected for would be 697 feet.

In correcting for temperature, Table I will be used; and for elevation, Table II, when special tables are not prepared under the direction of this Office.

37. The elevation to be corrected for at station No. —— is —— feet, as follows: Height of ——— above mean tide-level, —— feet. Height of ground (which should be a mark upon a door-sill, coping-stone, or other permanent object and noted in records) at office above or below datum-point, —— feet. Height of mercury in cistern of barometer above ground, —— feet. Total height to be corrected for, —— feet.

38. Observers will obtain from reliable sources the proper figures to fill up the blank spaces in the preceding paragraph, and will report them promptly to this Office on the form "Report of Instruments and their Positions," provided for this purpose.

In reporting the datum-point or bench-mark observers must be particular to give its *exact* location and the authority therefor; they will also, in every instance, give the authority for all measurements above or below such datum-points to the surface of the mercury in the cistern of the barometer, be assured that the measurements made by themselves are accurate, and must state it in such clear and concise manner as to leave no room for doubt in reference thereto at this Office. The data, step by step, from which the elevation of the datum-point above mean sea-level has been determined will be kept on file at the station. They will also briefly and clearly state on the form any other information in relation to the position of the instruments not provided for by the printed headings.

39. In moving a barometer even across a room, it should be screwed up and carried with the cistern uppermost. For traveling, it is provided with a wooden case. On steamboats or railroads, it should be hung up in a state-room or car, and the lower end firmly strapped to the side of the room or car to prevent jarring. In wheeled vehicles, it should be carried by hand, supported by a strap over the shoulder, or held upright between the legs; but it must *not* be allowed to rest on the floor of the carriage, as a sudden jolt might break the tube. If carried on horseback, it should be strapped over the shoulders of the rider, where it is not likely to be injured, unless the animal is subject to a sudden change of gait. When required for use, it should be taken from its case, gently inverted, hung up, and unscrewed. While it has the cistern uppermost the tube is full—is one solid mass of metal and glass—and not easily injured; but when hung up, a sudden jolt might send a bubble of air into the vacuum at the upper end of the tube, and the instrument become useless until repaired. Observers must never *swing* the barometer or endeavor to force the mercury against the top of the tube without first screwing up the large adjusting screw at the base of the cistern.

40. If the cistern should become dirty, it can be cleaned with safety and without changing the zero of the instrument. Everything used in the operation must be clean and dry. Blowing upon any of the parts must be avoided, as the moisture from the breath is injurious.

The instrument being placed vertically, the cistern uppermost, unscrew and take off the brass casing which incloses the wooden and leathern part of the cistern. This wooden part (which has the grain crosswise, and therefore is not air-tight) is made in two pieces, fastened together by four screws and four brass pieces. It will be necessary to take out two of these screws and loosen the other two, when the brass pieces can be taken off. The upper wooden piece, to which the bag is attached, can then be lifted off, and the mercury will be exposed. By then inclining the instrument a little, a portion of the mercury in the cistern may be poured out into a clean vessel at hand to receive it, when the end of the tube will be uncovered. This is to be closed by the *gloved hand;* when the instrument can be inverted, the cistern emptied, and the tube brought again to its vertical position. Care must be taken to prevent any mercury from passing out of the tube. The long screws which fasten the glass portion of the cistern to the other parts can then be taken off, the various parts wiped with a clean cloth or handkerchief, and restored to their former positions. The mercury which has been taken out of the cistern must now be cleaned, or replaced by other that is clean and pure. If the old mercury is merely dusty, or dimmed by a film of oxide, the cleaning may be effected by straining it through chamois leather, or through a funnel with a capillary hole at the end, of a size to admit of the passage of but a small thread of the metal. Such a funnel is conveniently made of letter-paper. The dust will adhere to the skin or paper, and the filtered mercury will present a clean and bright appearance. At stations where muriatic acid can be procured the mercury may be easily and quickly cleaned by mixing with it about two ounces of the acid in a small vessel or cup, and then pouring into the vessel clear water until it overflows and carries off all the impurities. When sufficiently pure, the water will be poured off, and the mercury heated over a gas or lamp light until all remaining moisture is expelled. If chemically impure, it should be rejected, and fresh, clean mercury used. With such clean mercury, the cistern should be filled as nearly full as possible, the wooden portions put together and securely fastened by the screws and clamps, the casing screwed on, and the screws at its end screwed up. The instrument can then be hung up and readjusted. If a little mercury has been lost during the operation, and there is none at hand to replace it, no serious harm has been done; but if much is lost, a little fresh mercury must be added to prevent the open end of the tube from becoming exposed while inverting the instrument. Should any air have entered the tube during the process of cleaning, efforts will be made to expel it by screwing the mercury into the tube, then inverting the instrument, loosening the screw, and tapping the top against the shoe. If this fails to expel the air, the fact that the barometer is unserviceable will be promptly reported to this Office.

41. Station barometers will not be cleaned or repaired unless ordered from this Office, or by an inspecting officer, or when such action appears to be absolutely necessary. In any case the fact will be promptly reported to this Office, stating the number of the instrument cleaned or repaired, with date and result of the operation, and the record of a full series of comparative readings taken immediately before and after cleaning be forwarded.

42. To take a reading of the barometer: 1st. Read the attached thermometer to the nearest half degree. 2d. Adjust the surface of the mercury in the cistern carefully to the ivory point, or zero of the scale. When the mercury is perfectly pure, the proper adjustment can be easily made by causing the actual point of the zero-pin to coincide exactly with its reflected image in the mercury below; but when the mercury is covered with a slight film of oxide, it is necessary to determine the contact by immersing the point in the mercury first, and then slowly lowering the screw until the depression caused by this immersion disappears. 3d. Tap the barrel of the barometer firmly, to free the mercury from the sides of the tube. 4th. Bring the lower edges of the vernier to the column of mercury, so that they exactly coincide with the top of the meniscus or curvature of the column, without cutting off any of the light at the angles. At night the light from the lamp must be thrown upon the paper. The barometer must never be viewed toward a distant white wall, nor a window, nor an artificial light, but always toward a piece of white paper in adjusting the vernier. 5th. A piece of white paper will be placed in the barometer box behind the tube to reflect the light and aid in setting the vernier accurately. 6th. The inches and tenths will then be read from the scale, and the hundredths and thousandths from the vernier.

43. Each observer, upon establishing a new station, will, as soon as he obtains the correct elevation of his barometer above sea-level, prepare a special table for reducing to sea-level the barometric observations made at his station.

44. This table will be made to cover the range of barometer (as reduced to sea-level) from 26.00 to 31.00 inches, and will give the reduction to sea-level to three decimal places, or to the nearest thousandths of an inch for every one-hundredth of an inch

of the barometric pressure, and for every five degrees of observed temperature of the air. For stations north of latitude 40° the table will cover a range of temperature from −40° to +100°; south of latitude 40°, the range will be from −10° to +110°, except in specially cold localities. Printed blank forms for the proper arrangement of this table will be furnished from this Office. The correction given in this special table will be obtained by simple interpolation from the general table No. II, page ——, of these instructions, and a full copy of such special table must be forwarded to this Office for revision and approval.

45. Until the special table for the station is approved, the individual readings of the barometer will be corrected from the general table.

46. Stations having an elevation over 2,000 feet will be furnished with a constant correction from this Office or with special instructions.

47. All extra barometers when not in use must be kept screwed up sufficiently to keep the cisterns filled to prevent oxidation of the mercury.

THERMOMETER.

48. The thermometer should be hung in the instrument-shelter in such a position that it will always be at least one foot from the window-panes or the wall of the building to which the shelter is attached. The instrument must be hung vertically, with the middle of the scale at a height that will bring it on a level with the eye of the observer. The readings should be made at all times, but especially in the winter, *through the panes* of glass, without raising the sash, when the shelter is built out from a window. When the shelter is built upon the roof, great care must be exercised in making the readings, in order to prevent the instrument from being affected by the heat of the body or the lantern at night. The observation must be made as rapidly as is consistent with accuracy.

49. The accuracy of all thermometers at each station will be tested on March 31, June 30, September 30, and December 31 of each year in the following manner:

Place the thermometers to be tested in the vessel provided for this purpose, keep them in a vertical position, pack finely-pounded ice around them to a height a little above the freezing point, and let them remain for one hour, at the expiration of which time read off the height of the mercury, without removing the thermometers from the ice, and note the result of the test of each thermometer in the daily journal, and report it to this Office in the journal abstract. If corrections have been authorized for any thermometer, the fact, with amount of such correction, will be stated. In testing the maximum thermometer it will be necessary to tap the bottom of it on the bottom of the vessel in which it is tested, to bring the mercury down to the temperature of melting ice, care being taken not to break the instrument during the operation.

Corrections will not be made for instrumental errors without authority from this Office.

MAXIMUM THERMOMETER.

50. The board which accompanies the maximum and minimum thermometers will be securely fastened with screws, in a horizontal position, upon the transverse bars which support the hygrometer and standard thermometer in the instrument-shelter.

51. For the support of the maximum thermometer, the long brass pin with a nut will be screwed into the board, in the hole to the extreme right. The nut will be taken off, and the pin slipped through the hole in the upper end of the instrument, which will be securely fastened by replacing the nut and screwing it tightly. The plain brass pin is then inserted in the hole at the left of the board, and the thermometer placed upon it so as to incline slightly in that direction.

The end of the pin to which the maximum is attached must be occasionally oiled to prevent friction.

The maximum temperature is obtained by noting the number of degrees upon the scale at the top of the column of mercury.

After making an observation the observer will remove the pin to the left, and, taking hold of the thermometer about three inches from the top, will spin it around several times, or until the top of the column is brought down to the temperature of the air at the time of observation. Care must be taken not to touch the bulb, and also that the nut is screwed up sufficiently tight to prevent the instrument from striking against the side of the board to which it is fastened. After adjustment, gradually raise the instrument to a horizontal position, and insert the pin as before.

Care should be taken in elevating the thermometer not to raise the bulb too high, as the column of mercury would then run to the upper end of the tube.

This instrument will be read daily at the time of making the 11 p. m. (Washington mean time) or last observation, and will then be set for the next day's observation, but, should a reading thereof be taken at any other time, care must be taken not to change the reading of the instrument.

MINIMUM THERMOMETER.

52. The brass support for the minimum thermometer will be screwed into the upper part of the board, and the holes so arranged as to slighty incline the left end of the support.

The top of the thermometer will be fastened by the small brass screw upon the support, while the lower end will be dropped into the notch to the left.

Upon receipt of a minimum thermometer at any station, it will be carefully compared with the standard, and if any portion of the spirit is detached from the column, the bulb will be immersed in warm water until the column reunites, *care being taken not to break the bulb by heating it too suddenly.*

After fastening the top of the instrument upon the support, the lower end will be raised until the top of the small index touches the top of the column of spirit.

The instrument is read by observing the number of degrees upon the scale where the top of the index rests. After taking a reading, the bulb or lower end of the thermometer should be elevated until the index touches the top of column, when the instrument will be dropped into the notch at the left of the support, as before.

The minimum thermometer will be read at the 7 a. m. and 11 p. m. (Washington mean time) observations. At the 7 a. m. observation care must be taken not to disturb the index, which will be set at the time of taking the night observation only. The minimum temperature at the time of making the 7 a. m. observation will form a part of the regular telegraphic report from all stations.

WATER-THERMOMETER.

53. The apparatus for noting the temperature of the water consists of a small thermometer, inclosed in a cylindrical metallic case. A portion of the case is hinged so as to be swung open when it is desired to read the thermometer. A valve at the bottom of the case admits the water as it sinks to the bottom of the river or lake, and, falling into place when the case is drawn up, prevents the water from escaping.

54. At stations provided with this thermometer one observation will be made at 3 o'clock p. m. (local time) daily, of the temperature of the water at the surface and bottom of the lake, bay, or river upon which the station is located.

The observer will select some convenient point on the shore (a wharf or pier, when practicable) where a sufficient depth of water exists to give a positive difference between the surface and bottom temperatures, and will provide himself with enough strong cord to reach the bottom at the place selected. One end of this cord will be securely fastened to the wire handle at the upper end of the cylinder inclosing the thermometer.

In making the observations, the observer will first note the temperature of the air at the surface of the water, then that of the surface-water by immersing the thermometer in the upper stratum of water, allowing it to remain long enough therein for the mercury to acquire the temperature of the water; and then, lowering the cylinder slowly to the bottom, will allow it to rest there long enough to fill; after which it will be drawn quickly to the surface, and the temperature shown by the thermometer carefully noted. The water will be poured out of the cylinder after each observation, and the thermometer thoroughly dried.

These observations will be recorded on Form 32.

HYGROMETER.

55. The hygrometer will be placed in the same shelter as the standard thermometer, and at a distance of one foot from it. The cistern will be kept supplied with pure rain-water at all times when the temperature of the air is above the freezing-point, and the cover of the wet bulb will be changed every month and the bulb carefully cleaned. The cover may be washed as often as necessary, without removal, by means of a jet of clean water from a small syringe.

When the temperature of the air is below the freezing point, the water will be emptied from the cistern, and in making an observation the wet bulb will be moistened with cold water, and the instant the mercury has reached its minimum its height will be noted. *Alcohol must not be used.*

The relative humidity of the air will be obtained from Table —, the manner of using which can best be given by an example.

Given dry-bulb thermometer (t) 97°, wet-bulb thermometer (t′) 76°, required corresponding relative humidity, vapor tension, dew point, and actual humidity. The difference of temperature is 21°. Place a ruler horizontally under the temperature of the wet bulb (t′) 76°. Where this meets the vertical column 21, take from the column marked at top R. H. the relative humidity 35, and from the column marked V. T. the vapor tension 0.61, and then from the table in lower right-hand corner, opposite the vapor tension 0.61, the corresponding dew point, D. P., and actual humidity, A. H., can be taken by inspection.

Thus, for $t=97^\circ$, $t'=76^\circ$, R. H.=35. V. T.=0.61, D. P.=64°.5, A. H.=6.58.
$t=68^\circ$, $t'=56^\circ$, R. H.=42. V. T.=0.29, D. P.=44°. , A. H.=3.31.

The values of the dew point and actual humidity are obtained by interpolation. The second sheet is to be pasted to the right of upper part of first sheet, and is for temperatures of the wet bulb from 50° to 104°, and for differences from 27° to 45°.

Especial care must be taken to keep the tubes of the hygrometer clean and the wet bulb properly moistened, and to make the observations and deductions accurately, as the humidity of the air forms an important element in all calculations of atmospheric changes.

To prevent the dry bulb of the hygrometer from showing a higher temperature than the exposed thermometer under similar exposure, the observer will cut a circular opening, about three inches in diameter, in the board to which the dry and wet bulbs are attached, and directly behind the bulbs.

ANEMOMETER.

56. The anemometer will be fixed in a vertical position upon the telescopic rod, the upper joint of which must be run up to its full extent, or, when this has not been furnished, upon a post of sufficient height to expose it to the full force of the wind. When possible, this post should be framed into the roof to steady it and prevent the instrument from vibrating; but when this cannot be done, it should be framed at the bottom into two pieces of scantling, not less than three feet in length, crossing each other at right angles, which can be nailed fast to the roof or platform upon which the instrument is placed. Short braces must be added, when necessary, to insure steadiness. The outer dial of the instrument is graduated in miles and tenths of miles, the figures 1, 2, 3, &c., indicating miles, and the subdivisions tenths. One complete revolution of this dial is equivalent to ten miles of wind. This anemometer registers up to nine hundred and ninety miles.

Observers will assure themselves by making a daily comparative reading that the record of the dials and that of the self-register agree at the time of changing the record sheets on the self-registering attachment at midday. When a discrepancy is found to exist between the two records, the anemometer will be carefully examined as to the condition of the dial-pegs or contact-pins (which should always be perfectly straight) and the contact-springs. The latter are liable to become corroded by the action of the electric spark or moisture, and must be kept clean and dry. When found, the defect should be remedied, and the cause of such discrepancy briefly explained by a marginal note on the sheet for the date, or dates, on which the discrepancy occurred. Should an anemometer be found to admit moisture, melted bees-wax will be applied to the joints.

Anemometers must be kept carefully and thoroughly oiled, to prevent friction and injury to the several bearings. Suitable oil for this purpose will be supplied from this Office upon application, and none other must be used after its receipt.

In making requisition for broken or defective portions of the anemometer, they will be designated by their appropriate letters, as shown in Plate No. ——, and the official number of the anemometer for which they are intended must always be given.

The screw posts must be kept bright, where they form connection with the conducting wires, to prevent resistance to the passage of the current.

Especial attention will be given to the large dial-screw, and when found loosened it will at once be tightened, but care must be taken not to screw it up tight enough to interfere with the free motion of dials.

57. The outer dial has one hundred and the inner dial ninety-nine divisions. As the dials are moved by the same wheel, they will move forward one hundred divisions in the same time. The outer dial having one hundred divisions, the inner dial will complete one revolution and its zero be one division beyond or to the left of the zero of the outer dial when the outer dial has completed one revolution, the zeros of the scales coinciding at the time the instrument was set in motion. Thus the revolutions made by the outer dial are recorded on the inner one, the number of revolutions being shown by the number of divisions of the scale on the inner dial between the zero of that scale and the zero of the outer one. In taking the reading of the anemometer at any time the hundreds and tens of miles are read from the inner scale, and the miles and tenths of miles are read from the outer one. Take from the inner scale the hundreds and tens of miles contained between the zero of that scale and the zero of the outer one, and the miles and tenths of miles on the outer scale contained between the zero of that scale and the index of the instrument, and the sum of these readings will be the reading of the instrument at the time of making the observation.

When the anemometer is not furnished with an index point, the center of the small wheel which gives motion to the dials will be taken as the reference point.

58. To obtain the velocity of the wind for the regular observations when the self-registering attachment is out of order, two readings of the outer dial must be taken with an interval of five minutes between them, and the *difference* between these readings will be the distance in tenths of miles traveled by the wind in that interval. This multiplied by twelve will give the proximate velocity in miles per hour. Example: Suppose the index of the anemometer to be at 3 on the outer dial when the first reading is taken, and at 3.6 five minutes after, the difference, .6, is the distance traveled in that time; and this multiplied by twelve gives a velocity of seven and two-tenths miles per hour. Whole numbers only will be used in expressing the velocity. When the decimal is *greater* than five-tenths, the unit's figure will be increased by one; when *five or less*, it will be thrown out.

The maximum hourly velocity of the wind when the self-registering attachment is used will be determined by multiplying the number of miles recorded in the fifteen minutes in which the maximum occurred by four, and, when the dial-readings are used, by multiplying the highest velocity in a period of five minutes by twelve.

The total movement by the wind in the preceding twenty-four hours, as shown by the anemometer, will be noted by the observer daily at 12 noon, local time (the time of changing the anemometer sheets), and recorded in the original record, on Forms 4, and on the anemometer sheets. The last will also give the velocity shown by the self-register, and will be recorded thereon in the following manner:

Total number of miles, self-register, 243.
Total number of miles, anemometer dials, 243.

In reckoning the number of miles recorded by the self-registering attachment, observers will count and record the number of spaces between the marks, and not the marks themselves.

The total movement for the twenty-four hours will be obtained in the following manner: Subtract the reading of the anemometer at 12 noon of the preceding day from the reading taken at 12 noon of the current day, and the difference will be the total movement of the wind. When the reading of the anemometer is less than the reading of the preceding day, nine hundred and ninety miles will be added to it, and the remainder, after subtracting the reading of the preceding day, will be the total movement.

Example: The dial reading of to-day is 91, and that of yesterday was 950; hence, we have $91 + 990 = 1081$; $1081 - 950 = 131$, the total movement of the wind in miles during the past twenty-four hours.

In case of the loss of record from the anemometer sheets for one or more days, blank sheets for the period during which the record is missing will be filled up with the name of station, proper dates, and on each a remark explanatory of the cause of the loss of the record, and be forwarded with the regular weekly package to this Office.

All entries on the record sheets, except the record marks made by the self-register, will be made in ink instead of lead pencil.

Whenever a station is not supplied with an anemometer, or the anemometer becomes unserviceable, and fails to record the movement of the wind, the force of the wind will be estimated and reported as light, gentle, fresh, &c., designation being taken from the column in the telegraph cipher headed "designation of wind force."

The instrument must not be taken apart unnecessarily, and those having the new style of contacts will be handled with especial care.

Observers must familiarize themselve with the construction of the several parts of the anemometer, in order that they may be able to locate faults whenever the instrument is out of order.

WIND-VANE.

66. Two wind-vanes will be furnished to each station; a small one to be sent with the observer for immediate use upon his arrival, and a larger one, or standard, to be sent as soon after the station is opened as practicable. When the latter has been received and placed in position, the small one will be removed, and carefully stored by the observer for use in cases of emergency.

67. The vane used for determining the direction of the wind must be set where the wind may act freely upon it, and must never be sheltered by surrounding buildings or other objects. Where the vane-rod does not pass through the roof to the office, the observer will mark upon a wooden dial, at the base of the upright which supports the vane, the true meridian and cardinal points of the compass.

68. At stations where the rod connected with the standard wind-vane passes through the roof and indicates the direction of the wind by an arrow in the office-room, the arrow will be adjusted to correspond exactly in direction with the vane itself, and, when such an adjustment has been made, the arrow will be securely fastened by means of the set-screw forwarded from this Office for that purpose.

A competent mechanic will be employed to perform such part of this work as cannot be done by the observer, and his bill forwarded for settlement in the usual manner.

69. When the large vane is received at any station, it will be immediately erected upon the building in which the office is located, provided the consent of the owner can be obtained, and the roof is strong enough to support its weight.

The general appearance of the vane and the location of the several parts are shown in Fig. 13. The iron straps which unite the two parts of the foot-block will be taken off and the block separated before raising the vane, in order to put the iron socket holding it in proper position. After the vane is up, the pieces will be fastened firmly together again by these straps. The central rod can be lengthened whenever necessary by adding a piece of the same diameter, and cutting a screw-thread on both ends.

When the office is on the upper floor, the central rod will be brought into the room and allowed to project about two inches below the ceiling. The gilded arrow will then be screwed on, and two circles drawn around it on the ceiling a little greater in diameter than the length of the arrow. On this circle will be painted the eight points of the compass used in the weather reports, care being taken to get the true meridian as a starting-point.

70. To fix the north and south line of the vane-circle in the "true meridian," place a table directly under the end of the vane-rod. Suspend a plummet from the center of the end of the rod. Place the compass upon the table with its center directly under the end of the plummet. If the variation of the magnet needle is given as *east* a certain number of degrees, turn the compass until the north end of the needle reads that many degrees *east* of the N point on the face of the compass. If the variation is *west*, turn the compass until the needle reads the given number of degrees *west* of the N point. Then lay a straight-edge across the face of the compass so that it will pass through the N and S points of the face, which are in the "true meridian," mark two points upon the table under the straight-edge; draw a straight line through these points; hold the plummet-string against the vane-circle and move it along until the plummet-point crosses the straight line on the table upon both the north and south sides; mark these crossings upon the circle, which are the "true" N and S points.

These instructions are based upon the supposition that the compass used is marked so that when placed upon a table and the observer sights from S to N the E point is on his right hand and the W to his left. Should the E point, as marked on the compass, be to the left and the W point to the right when the variation is given as *east*, turn the compass until the north end of needle reads the given number of degrees toward the west point; if *west*, turn it until the needle reads the proper number of degrees toward the east point.

71. At all stations supplied with the standard wind-vane, with the indicator extending through the roof to the office-ceiling, the words "*adjusted to the true meridian*" will be painted inside the vane-circle, upon the ceiling.

72. When permission cannot be obtained to put up the vane, the fact will be reported at once to this Office.

73. The observation of the vane requires more care than is usually given. In winds of considerable strength the vane is never at rest or fixed in the same direction; it oscillates incessantly, and its oscillations increase in extent with certain winds and with the violence of the wind. In such cases observers must *note the mean direction* between the extremes. When the wind is too light to move the vane, and when it is calm, no direction will be recorded. The attention of observers is called to this matter in order to prevent them from recording a direction of the wind when it is calm The direction of the wind will be designated by the eight principal points of the compass, N., N. E., E., S. E., S., S. W., W., N. W.

In reporting changes in the *direction* of the wind, the terms *veering* and *backing* will be used. The term *veering* indicates the changing of the wind from N. to E. to S., and so on, or in the direction corresponding with the movements of the hands of a watch; while *backing*, being the reverse term, indicates that it changes from N. to W. to S., and so on.

The bearings of the vane must be kept well and carefully oiled to prevent friction.

RAIN-GAUGE.

75. The rain-gauge will be placed, whenever practicable, with the top of the funnel-shaped collector twelve inches above the surface of the ground, firmly fixed in a vertical position, and protected from the interference of unauthorized persons. It will be examined at the time of making each of the three telegraphic observations, the amount of water it contains carefully measured by means of the graduated rod sent with each gauge, and then emptied and returned to its proper position. When a position at the level of the ground cannot be found with a sufficiently clear exposure, the gauge will be placed on the top of the instrument-room, or roof of the building occupied by the observer, who will measure the height above the ground, and report it to

this Office. The measuring-rod is graduated in inches and tenths of inches, and the proportion between the cylinder and funnel is as ten to one, so that ten inches upon the rod correspond with one inch of actual rainfall, one inch on the rod to one-tenth of rain, and one-tenth on the rod to one-hundredth of rain. Snow will be melted, and then measured and reported in the same manner as rain, *but the fact of its being melted snow must be noted under the head of remarks in the weekly reports*, and in the Original Record and the Daily Record of Observations. Whenever from any cause the snow cannot be melted, the depth will be measured and ten inches of snow reported as one inch of rainfall.

76. Stations in localities subject to heavy rainfall will be supplied with an attachment to the gauge of sufficient capacity to guard against overflow, but at stations where such rains are exceptional care must be taken by the observer to prevent overflow, by constant watchfulness during heavy rain.

* * * * * * *

79. Immediately after placing his instruments in position, each observer will make out and forward to the Chief Signal Officer, at Washington, a full report in writing, stating the kind, size, and position of room selected; the street and number of the building in which the room is situated; the position of each instrument, and its height above the ground, and also above the bench-mark furnished by this Office. In giving the height of the barometer, the measurement will be made to the surface of the mercury in the cistern. Whenever the position of any instrument is changed (which must not be done without good and sufficient cause) a record will be made of such change, with date and amount of difference in elevation; and the facts reported at once to this Office.

In addition to this information, such other facts will be stated as will enable the Chief Signal Officer to judge of the manner in which this part of the observer's duty has been performed.

* * * * * * *

FORMS.

117. The following-named meteorological forms are furnished by this Office for station use:

Form 1—Telegraphic river-report.
Form 2—Receiving-sheet.
Form 3—Daily manifold bulletin.
Form 4—Weekly report.
Form 5—Telegraphic report.
Form 8—Weather-map.
Form 15—Synopsis and indications.
Form 16—Monthly chart.
Form 22—Monthly mean.
Form 23—Cautionary-signal blank.
Form 24—Record of bulletins.
Form 25—Telegraphic-message form.
Form 26—River bulletin.
Form 27—Special river-report.
Form 28—Regular weeekly river-report.
Form 30—Monthly instruction-report.
Form 32—Monthly report—temperature of water.
Form 33—Comparative barometric readings.
Form 34—Annual mean or meteorological summary.
Form A—Record of telegrams refused by telegraph company.
Form B—Record of telegrams sent and received.
Form X—Weekly meteorological report from sunset stations.
Form Y—Monthly sunset report.

118. Form 1 is used by the special river-observers for their reports, and should be made in duplicate; one copy for file in the telegraph office at the schedule times, and the other to be forwarded to this Office at the end of each week.

119. Form 2 is for the use of the telegraph-operators in receiving the reports from other stations, and will be furnished by the observers in such quantities as may be required, care being taken to guard against wasteful and unnecessary use of them. The spaces will be filled up in regular order, commencing at the upper left-hand space, and filling each space to the right in succession on the first line and then commencing at the left-hand space on the second line, and so on. Observers will require the receiving operators to sign and date each sheet, and also to note the time the reports upon it were received, before taking it from the telegraph office. The time of receipt from the operator will be noted by the observer or assistant. When the reports are received in duplicate by the operator, observers will retain the original sheets furnished them by this Office.

After the reports have been translated and entered in the Bulletin, the receiving-sheets for each full report will be placed together, and folded neatly in three folds, parallel with the writing.

Each morning the three reports of the preceding day will be secured together, so as to form a single package. At the end of each week the seven daily packages for the week will be put in one neat package, and forwarded by mail to this Office, with the name of station plainly written upon the outer fold of the outside sheet.

120. Form 3 is the daily manifold bulletin issued for public information. The several columns will be filled up from the receiving-sheet, the words and figures being written plainly and distinctly.

Before making any entries upon the manifold form, the sheets will be carefully smoothed down, so that the registered lines of the several stations will fall directly over each other. If more than 15 bulletins are to be written, it is better to make out the number in two equal parts than to try and write them all at once, in order that all the copies may be legible.

The headings of the different columns indicate with sufficient clearness the matter to be filled in.

When any part of a report is not received, or, if received, is evidently incorrect, the word "Blank" will be written in the spaces to be filled by such part.

Absence of wind, clouds, rainfall, or change in barometer, thermometer, and river, will be indicated by the figure zero.

New stations, whose names are not in the printed list, will be written in the blank lines at the bottom of the form, or over the names of stations from which reports are not received.

Each copy of Form 3 posted must show the name of place where posted, date, and time of posting, and be signed by the observer or assistant making it out.

A file copy of Form 3 for each report will be preserved for office-reference, and suitable covers, for protecting these retained copies from defacement and other injury, will be furnished from this Office on application. One copy of the morning issue of the Saturday bulletin, on which the name of station from which sent must be plainly written, will be inclosed in Form 24 and mailed to this Office from each station.

121. Form 4 is the weekly meteorological report, three copies of which will be forwarded to this Office at the end of each week; one copy containing the full record of the telegraphic series of observations, one the record of the local series, and the third that of the midday observations.

In filling up this form, the *daily* means of the *local* (7, 2, and 9 o'clock), and the *weekly* means of the *telegraphic*, barometric and thermometric observations will be entered in their proper columns, and the words "Daily" and "Weekly," respectively, added to the heading.

In the telegraphic series will be given, first, the mean of the morning; second, that of the afternoon; third, that of the midnight observation.

* * * * * * *

125. Form 5 will be used for all of the telegraphic reports, and will be made out each time in duplicate, one copy for file in the telegraph office, for transmission by telegraph, and the other for transmission by mail to this Office.

In making the duplicates of this form, carbon paper and a lead pencil will be used, and *both* copies written at the same time.

The time of filing in the telegraph-office and the transmission of the reports must be filled in by the telegraph-operator who receives and transmits them, and verified by his signature.

* * * * * * *

133. Form 15 is for the Synopses and Indications, a copy of which, properly filled up, will be posted with each bulletin at all stations where they are received, and at which the Farmers' Bulletins are not printed. The midnight Indications will be used with the morning bulletin, and morning Indications with the afternoon bulletin, whenever practicable. At stations where the afternoon, and not the midnight, Indications are received, they will be used with the bulletin of the next morning.

In all cases the time and date of issue from Washington must be plainly written upon the form.

134. Observers will call the especial attention of the publishers of such papers as print the reports without proper official heading, time, and date, to the omission, and have it corrected when possible, as a matter of justice to this Office and to their readers.

135. Form 16 is the meteorological chart, to be made out monthly at each station, and forwarded by mail to this Office not later than the 10th of the month succeeding that for which it forms the record. In filling up this form the following instructions will be observed:

The time of beginning and ending of all auroral displays will be recorded in the spaces between the two upper lines, and under the proper dates, neatly written in black ink; when no auroras have been observed, the words "No Auroras observed" will be written opposite to the heading for these data.

For the thermometer, take the daily observations, and, with a sharp pencil, make a dot on the chart at the height at which the dry-bulb thermometer stood at the first observation of the first day of the month at its proper relative distance from the 12 m. (midday) line, as shown in Plate ——. Dot in a similar manner each of the seven observations. Join these dots with the pencil, and afterwards trace them with ink.

Continue the same process with the wet-bulb thermometer, reduced barometer, actual barometer, velocity of the wind, and the relative humidity, marking the direction of the wind in small letters at the point corresponding to the exact local time at which each observation was taken.

The average amount of clouds for each day will be given in the space immediately above the 29.00 inch line on the chart, dividing the squares into 1, 2, 3, and 4-4ths respectively.

The character of the sunset prediction, made each day at sunset, will be noted in the squares immediately above those used for the record of the clouds, and in the following manner: When the prediction is *fair*, by a red, yellow, or a green square, as the case may be; when *foul*, by a blue square, and when *doubtful*, by a half-red and half-blue square; the colored squares being of the same size as those used to indicate the amount of cloudiness.

The line representing the actual barometer (the barometer corrected for temperature and instrumental error only) will be drawn with *red* ink, and the line for the reduced barometer with *black* ink, so that the two may be easily distinguished from each other; and, on the left margin, opposite to the line representing the actual barometer readings, the words "Barometer Actual" will be written.

In case the scale on the chart does not extend low enough to comprehend the actual barometer readings, opposite to the reference line for 30.00 inches will be entered with *red ink* the number of the inch nearest to the normal barometer (corrected for temperature and instrumental error) and the scale graduated above and below it of sufficient compass for the range of the actual barometer; and on the left-hand margin the following note will be written:

"For (give name of station) the reference line marked 30.00 inches on the chart for reduced (sea level) readings is to be read ——— inches for actual barometer, which figures see in red ink opposite said line."

This note and the scale must invariably be written with red ink.

The rain and dry winds for the month will be entered on the bottom margin immediately to the left of the "Total Rainfall," thus:

Number of rain and snow storms preceded by winds from the

N.	NW.	W.	SW.	S.	SE.	E.	NE.	Calm.
0	0	1	2	3	2	1	2	0

In deciding whether a day is clear, fair, or cloudy, its character will be determined by taking the sum of the entire number of fourths of clouds observed at 7 a. m., 2 p. m., and 9 p. m. A clear day will be one in which the sum of the observed fourths is three or less than three; a fair day, one in which the sum is from four to eight, inclusive; and a cloudy day, one for which the sum is from nine to twelve, inclusive.

In filling up Form 16, the average cloudiness (in fourths) for the day will be entered. Average cloudiness will be found by dividing by three the sums above taken, and will be indicated as follows:

0 when the sum of the three observations is 0 or 1.
1 when the sum of the three observations is 2, 3, or 4.
2 when the sum of the three observations is 5, 6, or 7.
3 when the sum of the three observations is 8, 9, or 10.
4 when the sum of the three observations is 11 or 12.

The commencement of rain or snow will be indicated by a fine line one-sixteenth of an inch or less in length; the rate of fall by a broken curved line indicating the greater or less rapidity of the same; and the amount of water by a heavy straight line, conformably to any adopted scale, and with its right edge resting at the point representing the time it ceased. Should rain or snow continue falling after midnight of any day, the heavy straight line showing the amount which has fallen up to that time will be drawn, while a second broken curved line will be started to show the continuance of the same. When the time of commencement and ending of rain is known the lines will be drawn in black; but when the time is not known (this ought only to happen at night) the lines to express the data, whether the commencement or ending, or both, as the case may be, will be drawn on the chart at the place representing the time at which the commencement or ending is believed to have occurred, and in red ink.

As no fixed scale can be given for recording the amount of precipitation, it will be necessary for observers to adopt one, which should be made to comprehend the greatest amount of rainfall to be recorded in any one storm on any one date, but in all cases the scale used must be divided into *equal fractional parts of inches.*

When separate storms occur on the same day, separate records of amount should be made.

Different colored inks must be used for the several lines when the readings of the different instruments run close together or cross each other frequently.

In forwarding the charts by mail they must never be folded, but be rolled neatly and compactly around the paper tubes furnished for that purpose. As they are intended for future reference, care must be taken to make the data given upon them an accurate summary of the station observations for each month, as compiled from the official records.

The mean relative humidity, mean barometer, actual and reduced, mean temperature, prevailing wind, total movement of the wind, and total rainfall for the month must be entered in their proper places on the margin of the chart.

The name of the station and month for which prepared must always be plainly written on the right margin of the form. The range of temperature will be shown for each day by a vertical line crossing the temperature curve, as shown in Plate —. Care must be taken not to use too much ink in recording the rainfall, average cloudiness, and sunset predictions, as it penetrates the paper and injures the chart.

136. Form 22 is used for the record of the daily and monthly averages of the barometer and thermometer, the prevailing direction of the wind, amount of rainfall, and other data for the month designated by the headings of the form.

In filling up this form the daily averages of the thermometer readings for the local series of observations will be obtained by dividing the sum of the 7 a. m., 2 p. m., and *double* the 9 p. m. observations by four.

The average daily humidity will be obtained by dividing the sum of the 7 a. m., 2 p. m., and 9 p. m. observations by three. The *monthly* averages will be obtained by dividing the sum of the daily averages by the number of days in the month.

The monthly average of each series of the *telegraphic* (actual and reduced) observations will be obtained by dividing the sum of the observations recorded in each column by the number of days.

The total movement of wind during the month will be the number of miles counted from midnight of the last day of one month to midnight of the last day of the succeeding month, and will be the actual number recorded in the month. The maximum velocity of wind for each day will be calculated from the record sheet from midnight to midnight, as explained for computing other velocities.

In filling up that portion of the form prepared for rain-wind data, the following rules will be observed: In the—

First column, record day of month and year.

Second column, record whether rain, snow, hail, or sleet.

Third column, record actual time of commencement (hour of day), and, in case it commences before the ending of the preceding month, the date also.

Fourth column, record actual time of ending (hour of day).

Fifth column, record direction from which wind was blowing at each observation during continuance of precipitation.

Sixth column, record direction from which wind was blowing at each of the three observations immediately *preceding* the commencement of precipitation.

Seventh column, record direction from which wind was blowing at each of the three observations immediately *following* the ending of precipitation.

The wind directions recorded in columns 5, 6, and 7 must follow each other in the order in which the observations are taken.

When precipitation begins and ends between observations the words "No observation" will be written in the column headed "Direction of wind during rain or snow."

When an interval of 5 hours occurs between the ending of precipitation and its recommencement separate storms should be recorded.

Storms in which the amount of precipitation is too small to measure should not be considered.

The following is an example of the proper method of recording these data:

Date.	Rain, snow, hail or sleet.	Time of commencement.	Time of ending.	Direction of wind during rain, snow, hail or sleet at each observation.	Direction of wind at three (3) observations preceding rain, snow, hail or sleet.	Direction of wind at three (3) observations following rain, snow, hail or sleet.
1874.						
Dec. 1	Rain	8 a. m.	9. 25 a. m.	No observation	0., 0., N	S., S., S.
Dec. 3	do	4. 50 p. m.		NW. and S.	SW., S., S	
Dec. 4	do		1. 30 a. m.			N., N., N.
Dec. 6	do	6 a. m.	11 a. m.	W. W	W., S., S	N., N., NW.
Dec. 13	do	8. 40 p. m.	11. 30 p. m.	S. and W	S., S., S	S., S., NW.

Dec. 20	do	6. 40 a. m.	8 p. m.	NE., NE., NE.	NE., NE., NE	NW., NW., N.
Dec. 22	do	2. 06 p. m.	4 p. m.	No observation	S., S., S	S., S., SW.
Dec. 26	do	11. 50 a. m.	11. 10 p. m.	S., S., S., SW	S., S., NE	N., N., W.
Dec. 28	do	7. 30 p. m.		W., SW., S. 0	S., SW., S	
Dec. 29	do		9. 30 a. m.			NW, NW., NW

Special attention will be given to Form 22, and the several columns will be added up *twice*, both by the observer and the assistant, in order to secure accurate results. Copies of this form, properly filled up, will, at the end of each month, be furnished by observers to as many of the newspapers and other periodicals published at their stations as may desire to make use of it. One copy will also be forwarded to this Office on the *first* day of the month succeeding that of which it forms the record. Manifold books of this form will be furnished to those stations at which a large monthly issue is found necessary.

137. Form 23 is for use at stations designated for the display of cautionary signals, and will be filled up and forwarded weekly to this Office.

Care must be taken by the observer to accurately record the time of commencing, time when at its height, and time of ending of each gale, with prevailing direction and highest velocity of wind during the storm, and the direction of the wind at the time of the highest velocity of every storm which passes over his station, whether cautionary signals were ordered for it or not.

A display of signals will not be reported as justified unless the wind attains a velocity of twenty-five miles per hour.

A signal must never be reported *partly* justified, but, should the wind in the vicinity of a station be sufficiently great to justify a display of the signal, while at the station it should not reach the storm velocity, the signal should be reported as not justified, and the facts in the case be noted in the column for remarks, giving the character of sea, nature and extent of disasters, and any other data which would enable this Office to arrive at a proper conclusion in the case.

The off-shore signal will be reported justified as to velocity when the velocity of wind during the display of that signal reaches twenty-five miles, but not justified as to direction when the direction of wind is not off-shore, and fully justified when the velocity reaches twenty-five miles per hour, and the direction of wind is off-shore.

If an order to hoist signal is received after a gale has already set in, it will be noted and justified, but a note must be made in connection therewith to the effect that the order was received late, and the cause of its late receipt given, where it is known to the observer. If, however, a storm should end before an order to hoist a signal has been received, it will be recorded as a storm for which no signal was ordered, and the display of signals as not justified.

In the column of "Remarks" will be noted such special cases of benefits to commercial or other interests as may come to the observer's knowledge. It will also be stated whether any storm passed over the station during the week for which cautionary signals were not ordered.

All casualities resulting from storms at any cautionary station will be reported so far as they come within the knowedge of the observer. In giving this information, newspaper clippings may be used and forwarded with Form 23, fastened upon a separate sheet of paper in such manner that they can be easily detached for pasting in the office scrap-books.

* * * * * * *

140. Form 26 is the River Bulletin, and will be filled up as indicated by the several headings, and posted in such places as are found necessary to give suitable publicity to the reports and meet the wants of business men interested in them. The name and location of each place of display must be reported to this Office. A copy must be supplied regularly to each daily newspaper published at the station, and one copy will be forwarded to this Office on Saturday of each week.

* * * * * * *

142. Form 28 is for use at *all* river-stations, whether *regular* or *special*, and will be forwarded weekly to this Office, properly filled up, as indicated by the several headings. Under the head of "Remarks" on this form will be noted all unusual occurrences connected with the stage of water in the river at and near the station, such as the presence of floating ice, timber, &c.; formation and breaking of ice-gorges and other obstructions; damages to levees; time of opening and closing of navigation; accidents to gauge, or change in location of same, &c.

* * * * * * *

144. Form 32 is the monthly report of observations of the temperature of water, of which *two* copies will be forwarded to this Office on the first day of the month succeeding that of which it forms the record. The precise nature of the spot where the water-temperatures are taken must be noted under the head of "Remarks."

* * * * * * *

146. Form 34 is for the annual mean, or meteorological summary, which must be posted up in a conspicuous place in the observer's office. On this form will be entered, on the first day of each month, the data for the preceding month, as indicated at the top of the several columns. A carefully-compared copy of this form must be forwarded to this Office within fifteen days after the close of the year of which it forms the record, the original being kept for station-reference. Frames for the display of this form will be supplied on requisition.

* * * * * * *

153. In the Daily Journal will be entered all matters of interest not provided for in the various forms, such as meteoric and auroral displays, earthquakes, and unusual atmospheric appearances and disturbances, giving in each case, when possible, the time of beginning and duration of each. Whenever a meteor is seen by any observer, the "cloud" left by the meteor will be carefully noticed, both as to its appearance and the direction in which it *floats*, and a record and full description of the meteor and cloud will be entered. Especially will the observer enter a detailed account of the characteristic phenomena of every serious storm that passes over his station.

154. Observers will be particular to note in the journal every display of aurora, seeking by inquiry of others, if necessary, to make their record complete.

If the heavens are obscured by clouds so that the aurora, if present, cannot be observed, the word "obscured" will be entered in that part of the record devoted to auroral displays. If the sky is sufficiently clear for observation, the words "aurora" or "no aurora" will be entered, according as one is visible or not. When observed, a full account of the phenomenon will be entered in the journal, showing the exact minute of beginning and ending of the aurora and the principal phases of changes that it experiences. The following particulars should be especially noted: the azimuth and altitude of each extremity and of the crown of any arch of light, and the same data for any corona or glory that may be formed.

When the observer is familiar with the names of the principal fixed stars, he may locate the arch or crown by reference to them, but it is preferable that he should observe directly the altitude and azimuth.

155. Altitudes are expressed by degrees from the horizon to the zenith. If any circle be divided into three hundred and sixty parts, and the radial lines connect these parts with the center, each pair of lines subtend an angle of one degree; the fourth part of the circle will subtend an angle of ninety degrees, or one right angle, and the corresponding radii are perpendicular to each other; thus the zenith (that point in the heavens immediately above the observer) is ninety degrees from the horizon, or, in other words, its altitude is 90°. A point half-way up from the horizon to the zenith has an altitude of 45°.

Azimuths are also expressed in degrees, but are measured on the horizontal plane, and will be recorded as is done in astronomy, from the south point to the westward, passing successively the west, north, and east points of the compass until 360° have been passed over, and the south point is again reached.

156. Observers must be particular as to the date of the aurora; and when it begins in the evening of one day and continues into the early morning of the next day, it will be entered as occurring on the *first* day, but its details will be given in the record as occurring between the hours of its actual beginning and ending. Thus an aurora that began on the evening of the 12th of January and continued until the early morning of the 13th would be entered as the aurora of the 12th, but its details would be recorded as occurring, for instance, between the hours of 10 p. m. of January 12 and 2 a. m. of January 13.

157. All entries in the journal of occurrences and observations of any one day will be made under or opposite to that day, and not for a subsequent date. For example, an auroral display occurring May 23 should be entered opposite that date, and not referred to on the 24th as having occurred "last evening."

158. At stations west of the Mississippi River observers will note the date of appearance of Rocky Mountain locusts; the direction from which they come; the direction

and velocity of wind and character of weather at time of appearance; the length of time they remain in the neighborhood of the station, and amount of damage done by them; the direction and velocity of flight; direction of flight when they leave; whether they fly with or against the wind; whether or not they laid eggs in great quantities in the surrounding country; what means were taken to destroy the eggs or the locusts, and any other information that can be obtained on this subject. In addition to this a summary in regard to their appearance, numbers, damage done, &c., will be made as the concluding part of the abstract. Immediately after the 30th of June of each year a report on the Rocky Mountain locust, giving the following data covering the period from the first of July preceding, will be made:

(1.) Date and time of day of the arrival of swarms; 1*a*, direction and force of wind at the time; 1*b*, temperature and character of the weather at the time (clear or cloudy); 1*c*, direction of the flight, density, and extent of swarms.

(2.) Date and time of day of the departure of swarms; 2*a*, direction and force of the wind at the time; 2*b*, temperature and character of the weather at the time; 2*c*, direction of the flight, density, and extent of the swarms.

(3.) Date when the first eggs, if any, were deposited during the year.

(4.) Date when the eggs were most numerously hatching during the year.

(5.) Nature of the soil and situations in which the eggs were most largely deposited.

(6.) Nature of the soil and situations in which the young were most numerously hatched.

(7.) Date at which the first insect acquired full wings.

(8.) Date when the winged insects began to migrate.

(9.) Estimate the injury done in your county and State.

(10.) Crops which suffered most.

(11.) Crops most easily protected.

(12.) Crops which suffered least.

(13.) The prevailing direction in which the young insects traveled and any other facts in relation to the marching of the young.

(14.) The means employed in your section for the destruction of the unfledged insects or to protect crops from their ravages, and how far these have proved satisfactory.

(15.) The means employed in your section for the destruction of the winged insects or to protect crops from their ravages, and how far these have proved satisfactory.

(16.) Descriptions and, if possible, figures of such mechanical contrivances as have proved useful in your locality for the destruction of either the young or the winged insects.

(17.) To what extent have birds, domestic fowls, and other animals, domestic or wild, been useful in destroying these insects?

159. Observers must pay particular attention to accuracy in the use of the terms "*morning*" and "*evening*," and will be governed by the following instructions in reference to them:

Midnight is the moment, 12*h*. 00*m*. 00*s*., and is the beginning or first moment of the new day, and should receive the date of that day. Thus, whatever happened in the afternoon of June 10, at 11*h*. 59*m*. 59*s*., happened at 11*h*. 59*m*. 59*s*. p. m. June 10; whatever happened one second later was at midnight of June 10 and 11, and at one second later at 12*h*. 00*m*. 01*s*. a. m. of June 11. At midday of same date whatever happened at 11*h*. 59*m*. 59*s*. happened at 11*h*. 59*m*. 59*s*. a. m. June 11; at one second later it was noon June 11; at one second later it was 12*h*. 00*m*. 01*s*. p. m. June 11.

160. A monthly abstract of the entries in the journal will be mailed to this Office from stations east of the 100th meridian as soon as possible, and not later than the 5th day of each month. At stations west of that meridian they must be mailed as soon as possible, and not later than the second of the month. This abstract must contain all the important entries of the journal, especial care being taken to exclude all matters relating to the ordinary routine of observations that are given on the various forms. The abstract should show clearly and briefly all matters of interest not provided for in the regular forms, such as flight of birds, early vegetation, the movement of the Rocky Mountain locust (at stations west of the Mississippi River), meteoric and auroral displays, earthquakes, thunder-storms, distant lightning, high winds and gales, the occurrence of frost (particularly first frost and first killing frost), first ice, fog, polar bands, zodiacal light, and other unusual atmospheric phenomena, giving, whenever practicable, the time of beginning and duration of each. In each day's abstract the subject of auroras and the character of the sunset will be noted briefly in the authorized manner.

Whenever a tornado occurs in the vicinity of any station the observer will make diligent effort to obtain an accurate description of all meteorological elements accompanying the tornado; the hour and date of occurrence; direction of movement; appearance of the clouds; direction of the whirl; rain-fall; accompanying noise; length of track; average width at different points; amount of destruction to life and property, &c. So much of this information will be given as can be learned without leaving station for such time as to require special permission. The report required by these instructions will be entered in the journal, and also reported to this Office in the monthly abstract.

161. The following additional subjects will be noted: All changes in the working force of the station, with the date and nature of such change; all movements of office or instruments, with date of such movement, and authority for making the same. The condition of instruments and of other public property will form the closing part of each abstract—the instruments named separately, and the official number of each one given. When any instrument is reported unserviceable or out of order, the nature of the fault will be stated, and also whether a new one is required to replace it. When repairs can be made on station, this fact will be stated, with estimated cost.

162. At river-stations all special phenomena affecting navigation will be noted, such as the date of high and low water during the month, with monthly range at station; closing of the river by ice or from any other cause; formation of ice or other gorges, with effect upon navigation, &c.

163. At lake and sea-coast stations the opening and closing of navigation, with the name of the first vessel to arrive and the last one to depart, with the nature of the cargo in each case and the number of cautionary and off-shore signals displayed during the month will be reported, with results as far as known at each station; number of storms that passed over station for which cautionary or off-shore signals were not ordered, dates, with velocity of wind, being stated in each instance; and at all stations a summary of the sunset predictions, the number of each kind verified and the number not verified, will be made, and in case one or more predictions may have been missed, an explanation of their absence must be made in the summary.

* * * * * * *

ORIGINAL RECORD OF OBSERVATIONS.

188. The "Original Record" is intended to furnish the Central Office with data for the correction of errors made at the several stations in reducing and copying the observations. To make it of any value for this purpose the readings of the different instruments must be entered as made, and *not* copied in from a slip of paper. Observers will habitually carry this book when making an observation, and enter the readings in *pencil* as noted at the time. They will also use this book for making the proper corrections, as indicated by the marginal references. Pen and ink must *not* be used for entering any observation or correction.

The velocity of the clouds will be indicated by a single letter, following the direction, as follows: C for "no perceptible movement," S for "slowly," and R for "rapidly."

The character of wind will be indicated by the letters S for "steady" and V for "variable," following *both* the direction and velocity.

The occurrence of *first* "Frost" at station will be noted in this book under its proper date and time, and reported to the Central Office by telegraph in the prescribed manner.

Precipitation which is too small to measure will be noted in the proper space by a dash (—), and the words "Too small to measure" written on the margin of the page; the person who takes the observation always being careful to connect the dash (—) and the note by an asterisk (*) or other proper reference-mark.

Haze, smoke, and fog must not be recorded in fourths, but as "light," "dense," &c.

The occurrence of frost (except first frost), halos, coronæ, &c., being more properly journal entries, will not be recorded in the original record of observations.

In recording the amount of clouds, the upper should be noted as "hidden" when wholly obscured by the lower or fog; when more than one kind of upper is observed all the kinds will be entered in the space for upper clouds, and the amount and velocity of each kind be given in the spaces prepared for these data; so also in case more than one kind of lower clouds be observed.

When precipitation begins and ends after the last observation for the day has been taken, the time of such beginning and ending should be entered under the head of the first observation of the next subsequent day.

The character of rain, snow, &c., must invariably be designated as "light" or "heavy," as the case may be.

Whenever, from any cause, an observation is not taken, or is taken late, the reason therefor must be plainly written in all records and on all forms affected thereby in the space which such observation would have occupied had it been taken.

If an observation is taken fifteen minutes or more late, it will be recorded, with the *exact* time at which it was taken, but it will not be used in the computation of any of the means of the station; which fact must be clearly set forth by a remark in connection with such observation whenever recorded.

In case an instrument becomes unserviceable, the word "blank" will be written in the spaces for its readings, and an explanatory note made in connection therewith.

The name of the person taking observations must be signed in the spaces for that purpose at the bottom of the page, and to each observation.

Changes of the barometer since preceding observations will not be noted in this book.

All times of the beginning and ending of precipitation must be recorded when the interval between showers equals or exceeds fifteen (15) minutes.

Under no circumstances are observers allowed to make erasures or alterations in any observation recorded in the original record of observations, nor is it allowable to write one figure over another after it has been recorded. If an error has been made, the correct reading will be noted on the margin of the page, in connection with an explanatory note in reference thereto.

The book will be forwarded to this Office not later than the 10th of the month succeeding that of which it is the record.

* * * * * * *

249. Observers will give close attention to the observation and record of all local premonitory signs of storms or changes of weather, and report them promptly to this Office. The following points should be particularly noted before, during, and after a storm or change of weather: Direction and force of the wind; kind, direction, motion, and appearance of the clouds; action of the barometer and thermometer, and such other purely local causes as appear to influence the results.

250. The attention of sergeants or other enlisted men in charge of stations is directed to the fact that they are required to make their reports absolutely correct, and that any shortcoming in this respect renders them liable to punishment. Aside from this, it should be kept constantly in mind that a single incorrect report may cause the loss of life and property to an unknown amount, and all reports must be made with this responsibility clearly in view. Whenever an observer is unable from any cause to get in his report, properly corrected, at the regular hours of report, he will *not* send the uncorrected portion, but will write the word "Blank" in each of the spaces that would otherwise have been occupied by this portion of the report. Observers will *never* send any report or part of report which they have reason to believe is incorrect, and will bear in mind that it is safer and more in accordance with instructions to omit a report than to make a false one.

* * * * * * *

PAPER 23.

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL-OFFICER,
Washington, D. C., July 2, 1877.

The following rules in regard to sunset observations and verifications of reports based upon them are furnished for your information and guidance:

1. The observer at each station will note, each day, at the exact time of sunset (which he will obtain from circular No. 3, herewith inclosed), and for a time not to exceed thirty minutes after sunset, the character of the western sky and sunset, and will note in writing on Form Y, in the column for that date, the character at the time as "Fair weather sunset," "Foul weather sunset," or "Doubtful weather sunset."

The term "Fair weather sunset" will express such condition of the sky, particularly the western, and such character of the sunset, as is considered to indicate a fair day for the day *ensuing*.

The term "Foul weather sunset" indicates that the appearances are such as to presage a rainy day for the day ensuing.

The term "Doubtful weather sunset" will indicate that the conditions are such as to leave the mind of the observer in doubt as to what the sunset presages for the following day.

The prediction is for the period of time from the sunset of the day on which the prediction is made until sunset of the following day; and at the expiration of the time for which the prediction is made the observer will note on Form Y, opposite the prediction and in the column headed "Report correct," the word *yes* or *no*, according as the prediction is or is not verified.

A sunset prediction of one day is verified or not verified, as the case may be, by the weather of the ensuing day.

The prediction "Foul" or "Fair" refers especially to rain, and does not refer in any way to amount or kind of clouds or fog.

The prediction "Foul" means that the appearance of the sky indicates *rain*; if any rain equaling or exceeding one one-hundredth of an inch falls before sunset on the ensuing day the prediction is verified, and if not, it is not verified.

"Fair" means that the appearance of the sky does not indicate rain, and if no rain equaling or exceeding one one-hundredth of an inch falls, the prediction is verified. If any rain in excess of this amount does fall, the prediction is not verified.

"Doubtful" sunsets cannot be verified.

As soon as the observation has been taken and entered on Form Y, the report will be enciphered (or written) on Form 5, in duplicate, and the form handed to the operator in the telegraph office as soon as possible after the observation is taken, for transmission to ———.

The signature of the operator must be obtained to both copies of each report, with the exact time of receipt by him. The operator will retain one copy of the report; the observer will retain the other copy until Monday of the following week, when he will forward the retained copies by mail to this Office in the same envelope as Form X.

In filling up Form 5, carbon paper and stylus will be used in the following manner: two sheets of the printed forms will be raised up and the piece of sheet tin placed beneath them; one of the sheets will be spread smoothly on the tin; on this sheet will be placed a piece of carbon paper, and the other form will be placed on this. When the cipher-words representing the readings of the instruments are written in the proper spaces of the Form 5, the report will appear in duplicate.

The observations will be written on the Forms 5 in the following manner:

The name of station (   ) will be written in the upper left-hand or first space; the cipher-word for the sunset prediction in the second space, and will be found in the table showing amount of clouds at the time, opposite the sunset prediction, and under the letters showing the direction from which the wind is blowing at time of observations.

In the third space will be written the cipher-word found opposite the observed reading of the barometer.

In the fourth space will be written the cipher-word found opposite the readings of the dry-bulb thermometer.

In the fifth space will be written the cipher-word found opposite the readings of the wet-bulb thermometer.

In the lower left-hand space will be written the cipher-word corresponding to the amount of rain-fall since the observation of preceding day.

The report will be signed with the surname only of the observer.

Examples are given of the proper manner of filling up Forms 5.

EXAMPLE.

Sunset	Foul.
Direction of wind	E.
Amount of clouds in fourths	$\frac{4}{4}$.
Barometer	18.75.
Dry-bulb thermometer	39°.
Wet-bulb thermometer	23°.
Amount of rain-fall since last report	None.

If no rain has been collected in the rain-gauge since the last report the cipher-word for rain-fall will be omitted from the report, and, until you have received a barometer, the word to express the reading of that instrument will also be omitted, and the words for the readings of dry-bulb and wet-bulb thermometers and amount of rain-fall be moved up one space.

The observation of the sunset, the direction of wind, and amount of clouds will be made at the times given in Circular No. 3. The observations of barometer, thermometers, and rain-fall, since observation of preceding day, will be taken at ——— each day.

In the form for the "Meteorological Record" for the week (Form X) should be entered as soon as possible after the observation is taken, and in the proper columns, the date of observation, hour of observation, reading of aneroid barometer, readings of dry and wet bulb thermometers, direction of wind, and velocity of wind in miles per hour (estimated from the Signal Service scale), amount of clouds in fourths, time (a. m. or p. m.) rain or snow began and ended, amount of rain or melted snow since last observation in inches and hundredths of an inch, state of the weather, and any remarks about the weather which, in the opinion of the observer, will be of interest, such as dates of auroras, thunder-storms, &c.

This form, properly filled up, should be forwarded by the mail on Monday, in an envelope addressed:

"THE CHIEF SIGNAL-OFFICER OF THE ARMY,
Washington, D. C."

Form Y will be forwarded to this Office on the *first* day of the month succeeding that of which it forms the record.

Instructions for reading the instruments.

ANEROID BAROMETER.

If the observer stands facing the barometer, the short arm will move to the right as the pressure of the atmosphere or weight of air increases, and to the left as the pressure diminishes. The long arm should be moved so as to coincide with or directly cover the short arm, and the reading of the barometer is obtained by reading from the lowest reading found on outer scale to the division of that scale to which the long arm points or which it covers. The inches and hundredths of inches are marked on the scale. The inches and hundredths are counted from left to right, or in the same direction as the hands of a watch move. The inches and hundredths are written in the same manner as dollars and cents, thus: One dollar and seventy-five cents would be written $1.75, or one and seventy-five hundredths, $29.35, twenty-nine dollars and thirty-five hundredths.

The barometer reading 29 inches and thirty-five hundredths of an inch would be written 29.35 inches, &c.

THERMOMETER.

In reading the thermometer the observer should be careful to place the eye at the same level as the top of the column of mercury, otherwise the reading will not be correct.

WET-BULB THERMOMETER.

A piece of wicking six or eight inches in length should be used with this thermometer, one end being drawn over the bulb until it is entirely covered, and the other end placed in the cistern which is on the wooden frame. The cistern should be kept filled with pure rain-water at all times when the temperature of the air is above freezing-point, and the cover should be changed once a month and the bulb carefully cleaned. The cover can be kept clean by washing it (without removal) by use of a jet of water thrown from a small syringe.

When the temperature of the air is below the freezing-point the water will be emptied from the cistern and the bulb moistened with water. By watching the mercury in the tube it will be seen to fall for a few minutes and then to rise again. The height of the mercury, or reading of thermometer, when at its lowest point, should be read.

WIND VANE.

The vane used for determining the direction of the wind must be set where the wind will act freely on it, and must never be sheltered by surrounding buildings or other objects.

The direction of wind is indicated by the point of the horizon from which it comes. Thus a north wind is one blowing from the North, an east wind is one blowing from the East, a south wind is one blowing from the South, &c. The direction of the wind will be designated by the eight principal points of the compass, N., E., S., W., N.E., S.E., S.W., N.W.

The wind vane and stand consist of the following parts:

1st. Upright staff about five feet in length, at the lower end of which should be cut a tenon about one inch in length; near upper end are two holes which cross each other at right angles, and through which are passed the iron arms (marked 3), at the ends of which are the letters N. and S. and E. and W. A hole is bored in the *upper* end of staff, in which the slender iron (marked 4) is screwed, and on which the wind vane (marked 5) is placed.

2d. Four iron braces.

3d. Two iron arms with letters N. and S. and E. and W. at the ends.

4th. Slender iron rod on which the vane is placed.

5th. Wind vane.

To place the vane and stand in position, a small platform, about two and a half feet square, should be placed on roof of observer's office and carefully leveled. A hole to receive the tenon at the foot of staff should be cut in center of platform. Draw upon the platform the true meridian line passing through the center, and mark the ends of the line N. and S. respectively.

To determine the true meridian line, place the compass with its center over the center of the hole in the platform; place the eye at south end of needle, and mark on platform a point toward which the north end of needle points; place the eye at north end of needle, and mark the point towards which the south end of needle points. Draw through the points thus determined and the center of platform a line, which will be the magnetic meridian.

The variation of the needle at your station is ° east; that is, the needle points ° east of the true north.

On "Plate I" will be seen two lines which cross each other at the point "O." One of these lines is marked simply "N." and "S."; the other line is marked "True N." and "True S." Place this plate with the point marked "O" at center of platform, and so that the line marked "N." and "S." immediately covers the line (or magnetic meridian) which has been marked on platform. Mark on the platform where the line marked "True N." and "True S." reaches edges of plate; a line drawn through these points and the center of platform will be the true "N." and "S." line, or true meridian. Paint on the platform a circle (whose center coincides with the center of the platform) having a diameter of about two feet, and on this circle mark the four cardinal points, N., E., S., and W., and the four intermediate points, N. E., S. E., S. W., and N. W. Unscrew the nuts at ends of iron arms (3), take off the movable letters, pass the rod through the holes drilled near upper end of staff, put on the letters and screw on the nuts. Screw the slender iron rod (4) into the hole in end of staff. Place a screw about six inches above the lower end of staff and immediately below the end of arm on which the letter "N." is placed. Place the tenon at foot of staff in the hole in center of platform, and turn the staff until the screw under letter "N." is immediately over the meridian line; the arm with letter "N." will be immediately over the end of meridian line (marked "N."), and therefore points to the true north. Place the staff in a vertical position, this being determined by the use of a plumb line; fasten one end of each of the iron braces (2) to the platform and the other end to the staff, so as to hold the latter firmly in position. Place the wind vane on the slender rod (4), passing the rod through the hole near the center of vane.

In determining the direction of the wind at the time of observation, the division of the circle which most nearly coincides with the direction in which the arrow-head of vane points will be taken as the direction of the wind.

In winds of considerable strength the vane is never at rest or fixed in the same direction; it oscillates incessantly, and its oscillations increase with the violence of the wind. In such cases observers must note the mean direction between the extremes. When the wind is too light to move the vane and when it is calm no direction will be recorded.

RAIN GAUGE.

The rain gauge will be placed, whenever practicable, with the top of the funnel-shaped collector twelve inches above the surface of the ground, firmly fixed in a vertical position and protected from the interference of unauthorized persons. It will be examined at time of making the daily observations, the amount of water it contains carefully measured by means of the graduated rod sent with each gauge, and then emptied and returned to its proper position. When a position at the level of the ground cannot be found with a sufficiently clear exposure, the gauge will be placed on the top of the instrument room or roof of the building occupied by the observer, who will measure the height above the ground and report it to this office.

The measuring rod is graduated in or divided into inches and tenths of inches, and the proportion between the cylinder and funnel is as ten to one, so that ten inches upon the rod corresponds with one inch of actual rain-fall, one inch on the rod to one-tenth of rain, and one-tenth on the rod to one-hundredth of rain. Snow will be melted and then measured and reported in the same manner as rain, but the fact of its being melted snow must be noted under the head of remarks in the weekly reports.

Whenever from any cause the snow cannot be melted the depth will be measured and ten inches of snow reported as one inch of rain. The rule for determining the amount of rain-fall from the amount of water collected in the tube is as follows, viz:

Measure the amount of water in the tube with the measuring stick, which is divided into inches and tenths. Divide the amount of water found by ten, the quotient will be the amount of rain-fall.

EXAMPLES.

Amount of water in tube	1.4 inches.
Amount of rain-fall	0.14 inch.
Amount of water in tube	15.6 inches.
Amount of rain-fall	1.56 inches.
Amount of water in tube	0.1 inch.
Amount of rain-fall	0.01 inch.

When reports cannot be forwarded on the day on which they are taken, they will not be transmitted by telegraph.

C. E. KILBOURNE,
First Lieutenant Second U. S. Artillery, Acting Signal Officer and Assistant.

PAPER 24.

S. S. ——— ———.

Bulletin for the —— half of the month of ———, 18—, of simultaneous international meteorological observations, taken each day at 7 a. m., Washington mean time (12.08 *p. m., Greenwich mean time*).

Day.	Station. (Harbor, or latitude and longitude at 7 a. m., Washington time.)	Barometer. ——feet above sea-level.	Attached thermometer.	Temperature. (Fahrenheit.)		Wind.		Clouds.		Rain-fall in 24 hours.	Sea-swell.		Weather.	Ship's course and distance sailed since last report.	Signature of observer.
				Dry bulb.	Wet bulb.	Direction from which coming.	Force.	Amount.	Direction from which coming.		Character.	Direction from which coming.			

☞ See notes on the back of sheet.

Barometer error ———.
Last comparisons at ———.

[On the back of the foregoing.]

NOTE.—A brief account of any remarkable storm may be indorsed hereon below.

S. S. —— ——.

Bulletin of simultaneous international meteorological observations for the —— half of ——, 18—.

Respectfully forwarded to the Chief Signal Officer of the Army.

—— ——,
Commanding.

NOTES.

1. These observations must be taken and recorded each day without fail, at the precise hour, 7 a. m., Washington mean time (12.08 p. m., Greenwich mean time).

2. The *mercurial barometer* is to be used when possible. When the *aneroid barometer* is used, as, for instance, on account of the ship's motion, a letter (*a*) is to be placed after the reading, and the aneroid is to be regulated at all times by the mercurial barometer.

3. When, from stress of weather or other causes, all the observations cannot be made, part of them must be invariably given. For instance, if it is not possible to say more than "violent gale," let that be said.

4. The *direction of the wind* is to be given by compass point (corrected for variation) as closely as possible. *Wind force* may be given by Beaufort scale of numbers 0 to 12, or in velocity of miles per hour or pressure per square foot, where there are anemometers.

5. One of these blanks, filled out for the first fifteen days of the month, to be mailed on the fifteenth day of each month, or as soon thereafter as practicable, and one filled for the remaining days of the month, to be mailed on the first day of the month, or as soon thereafter as practicable, addressed to the Chief Signal Officer of the Army, Washington, D. C.

6. Commanding officers of vessels will cause frequent comparisons of barometer readings to be made with those of the Signal Service whenever practicable, and as frequently as may be found necessary to obtain correct results—the comparisons, of course, to be made at precise common time, as, for instance, at 7 a. m., 2 p. m., and 9 p. m., for several days together, and at whatever of the signal stations may be convenient at the time.

7. Whenever in foreign waters, like comparisons will be made if practicable with the barometers of United States naval vessels wherever the commanding officer has reason to believe additional accuracy can be obtained. On every report forwarded the barometer error (+ or —) will be noted, and *not applied to the observations.* (See space at foot of blank.)

8. The reading of the attached thermometer must be given with all readings of the mercurial barometer. The blank for height of barometer above sea-level must be filled on shipboard by finding the height, in feet, of the cistern of the barometer, as hung in the ship, above the water-line, whenever the ship is in port. Give reading of barometer as *read off*, leaving all corrections and reductions to be made elsewhere.

9. Clouds, amount, must be reported as follows: Sky clear, 0; one-fourth covered, one-half covered, three-fourths covered, four-fourths covered.

10. Sea-swell may be reported as follows: Smooth, moderate, long, rough, cross, heavy, and very heavy.

11. Weather: Use words clear (when sky is less than one-fourth covered); fair (sky from one to three fourths covered); cloudy (sky more than three-fourths covered); sprinkling, drizzling, light (or heavy); rain, sleeting, hailing, thunder-storm, foggy, misty, hazy, threatening, clearing, &c. The above to express the state of weather, as the case may be, at the *moment of observation.*

12. If any observation is not taken, write in the space the word "blank."

It is requested the above directions be strictly complied with.

ALBERT J. MYER,
Brig. Gen. (Brevet Assigned), Chief Signal Officer, U. S. A.

PAPER 25.

WAR DEPARTMENT, OFFICE OF THE CHIEF SIGNAL OFFICER,
Washington, D. C., August 15, 1878.

Instructions for shipmasters comparing barometers with the Signal Service standard at the Maritime Association building in New York.

The upper surface of the mercury in the cistern of the large standard barometer is 11 feet and 6 inches above mean tide. The ship's barometer should be hung alongside and at the same elevation. A table for reducing the barometric readings to 32° Fahrenheit (freezing) will be found at the barometer desk. To all readings of the large standard barometer allow for the reduction to freezing to obtain the true reading. The difference between this corrected reading and the reading of the ship's barometer, similarly reduced to freezing, will be the correction to be always applied (that is, to be added to or subtracted from) to the readings of the ship's barometer, in order to make sure that these readings are correct. To illustrate by an example: the reading of the standard barometer reduced to feezing is, say, 29.985, and the reading of the ship's barometer to be compared, reduced to freezing, is, say, 29.970; in this case the standard is the higher, and the difference (.015) is to be added to all readings of the ship's barometer to obtain the standard reading. As another illustration: let the reading of the standard be, as above, 29.985, and the reduced reading of the compared ship's barometer 30.01; in this case the standard is the lower, and the difference (.025) is to be subtracted from all readings of the ship's barometer to obtain the standard reading. The comparisons are similarly made, though not so closely, and the correction determined, though the ship's barometer may not be scaled to very close readings, or of thousandths. The correction for the instrumental error of each ship's barometer, as thus determined, must be applied whenever corrected readings are desired.

For all reports made to this office, if such are made by any vessel, it will be sufficient to give, when a mercurial barometer is used, 1st, actual reading of barometer as read off; 2d, correction for instrumental error determined as stated above; 3d, reading of the attached thermometer; 4th, height (as nearly as possible) of barometer, as hung on shipboard, above the sea-level. These ought to appear on each separate form or report sent to this office.

Aneroid barometers are compared with standard mercurial barometer by first reading the mercurial barometer and correcting this reading for temperature only—that 32 reducing the reading to what it would be if the temperature of the barometer was is° Fahrenheit. Then read the aneroid and take the difference between the corrected e2ading of the mercurial and the actual (uncorrected) reading of the aneroid, which will be the correction to be applied to the aneroid; this correction to be added if the aneroid reads lower than the mercurial, and subtracted if it reads higher.

On all reports made for this office, when an aneroid barometer is used, the record should give, stated on the form, 1st, actual reading of the barometer as read off; 2d, correction for instrumental error, determined as above; 3d, reading of attached thermometer if there is one, or of a thermometer in the room; 4th, statement whether the barometer is "compensated" or not; 5th, height (as nearly as possible) of the barometer, as hung on shipboard, above sea-level.

A sergeant or assistant of the Signal Service will be in attendance at the Maritime Association building each day, from 12 to 1 p. m., to give any necessary information as to mode of making comparisons. The barometer case and the door of the screen will be opened at the hours named only, unless in instances of special need, and always in the presence of the sergeant or assistant.

Shipmasters of all nations are invited to make use of the Signal Service standard for the purpose of comparing their ships' barometers. The superintendent of the room of the Maritime Association will take charge of ships' barometers to be compared at any time they may be left with him for the purpose. They will be duly delivered by him to the sergeant or assistant in charge of the standard. Ships' barometers can be most conveniently returned to owners at the hour between 12 m. and 1 p. m.

ALBERT J. MYER,
Brigadier-General (Brevet Assigned), Chief Signal Officer, U. S. A.

PAPER 26.

List of merchant and naval vessels and naval stations from which simultaneous meteorological reports have been received at the office of the Chief Signal Officer during the year ending June 30, 1880.

MERCHANT VESSELS.

Name.	Months for which reports were received.	Line.
Steamship Circassian	January, 1880	Allan Line.
Steamship Hibernian	November and December, 1879, and January to May, 1880, inclusive.	Do.
Steamship Moravian	February and March, 1880	Do.
Steamship Peruvian	February, 1880	Do.
Steamship Sardinian	February, March, and April, 1880	Do.
Steamship Sarmatian	January, February, March, 1880	Do.
Steamship Illinois	1st half of January, 1880	American Steamship Company.
Steamship Indiana	June to December, 1879, and January to May, 1880, inclusive.	
Steamship Ohio	February to June, 1880, inclusive	
Steamship Newbern	February to May, 1880, inclusive	California and Mexican Steamship Line.
Steamship Samaria	April and May, 1879	Cunard Line.
Steamship Scythia	March and April, 1880	Do.
Steamship America	March, 1880	North German Lloyd of Bremen.
Steamship Braunschweig	June, August, September, October, 1879, and March to May, 1880.	
Steamship Ohio	May to December, 1879, inclusive, and January, 1880.	
Steamship Leipzig	June, July, August, September, November, and December, 1879, and January, February, and March, 1880.	
Steamship Strassburg	April, 1880	
Steamship Belgic	April, 1879, to April, 1880, inclusive	Occidental and Oriental Steamship Company.
Steamship Gaelic	May, 1879, to May, 1880, inclusive	
Steamship Oceanic	June, July, and August, 1879	
Steamship Geo. W. Elder	January to May, 1880, inclusive	Oregon Railway and Navigation Company
Steamship Ancon	February to June, 1880, inclusive	Pacific Coast Steamship Company.
Steamship State of California.	April, May, and June, 1880	
Steamship Idaho	May, 1880	
Steamship City of Chester	January to April, 1880, inclusive	
Steamship Alaska	February, 1880	Pacific Mail Steamship Company.
Steamship City of Panama	February to May, 1880, inclusive	Do.
Steamship City of Sydney	March to June, 1880, inclusive	Do.
Steamship City of Tokio	April to September, 1879, inclusive	Do.
Steamship China	March, April, and May, 1880	Do.
Steamship Colima	June to September, 1879, inclusive, and February to May, 1880, inclusive.	Do.
Steamship Dakota	May, June, July, 1879, and February to June, 1880, inclusive.	Do.
Steamship Granada	March to June, 1880	Do.
Steamship Zealandia	March to October, 1879, inclusive, and February to May, 1880, inclusive.	Do.
Steamship Belgenland	December, 1879, and January to May, 1880, inclusive.	Red Star Line.
Steamship Nederland	June, July, and September, to December, 1879, and January, 1880.	Do.
Steamship Adriatic	April and May, 1880	White Star Line.
Steamship Britannic	January, April, May, and June, 1880	Do.
Steamship Celtic	March, April, May, and June, 1880	Do.
Steamship Republic	April and May, 1880	Do.
Steamship Abana	August, September, and October, 1879	British vessel.
Schooner Abby K. Bentley	March to June, 1880, inclusive	
Schooner Addie Fuller	June to November, 1879, and March to June, 1880, inclusive.	
Brigantine Agnes Wilson	January and February, and April to July, 1879	British vessel.
Airlie	January, 1879	Do.
H. M. S. Alert	January, 1879, to January, 1880	Do.
Brig Alliance	January, February, March, May, June, July, August, October, November, December, 1879.	Do.
Steamship Amanda	January to April, 1879	Do.
Schooner Annie R. Lewis	April, May, and June, 1880	
Steamship Algeria	August, 1878, to March, 1879; May to August, 1879; and January, 1880.	British vessel.
Steamship Arno	February, 1879	Do.
Astarte	January and February, and April to July, 1879	Do.
Atmosphere	April, May, July, and August, 1879	Do.
Ship Bowfell	May to August, 1879	Do.
Ship British Commodore	February to May, 1879	Do.
Bark Belleisle	November, 1878, to April, 1879; July and August, 1879, and January, 1880.	Do.

List of merchant and naval vsssels and naval stations, &c.—Continued.

MERCHANT VESSELS—Continued.

Name.	Months for which reports were received.	Line.
British Peer	March to July, 1879	British vessel.
City of Agra	January to April, 1879	Do.
City of Cashmere	January and February, 1879, and April, 1879, to March, 1880.	Do.
Brigantine Carrie Hechle	December 5, 1879, to February, 1880	
Bark Commewyne	January to May, 1879, and July and August, 1879; October, 1879, to February, 1880.	British vessel.
Bark Decapolis	January, 1880	Do
Schooner Delia Hodgkins	July and August, 1879	
Ship Denbighshire	January to March, 1879	British vessel.
Bark Dochra	January, 1879	Do.
Bark Drumclog	May, 1879	Do.
Early Moon	March, 1879	Do.
Brig Endymion	October and November, 1879	Do.
Steamship Ethiopia	July to December, 1879, and January, 1880	Do.
Barkentine Fylde	March, April, July, August, and September, 1879	Do.
H. M. S. Fawn	January to August, 1879	Do.
Bark Fedalma	April, June, and August, to December, 1879; January to March, 1880.	Do.
Steamship Gorden Castle	January, February, July, August, and September, 1879.	Do.
Steamship German	September, 1879, to March, 1880	Do.
H. M. sloop Gannet	May to December, 1879	Do.
Brigantine George	June to September, 1879, and January to June, 1880.	
Schooner W. D. Hilton	June, 1879	
Steamship Haytien	October, 1879	British vessel.
Schooner Henry Whitney	May and June, 1879	
Schooner Harry and Fred	April, May, and June, 1879	
Ship Hippolyta	April to May, 1880	British vessel.
Bark Hope	February, 1879	Do.
Ship Iron Cross	June, August, September, and December, 1879; and January to March, 1880.	Do.
Ship Jumna	June, 1880	Do.
Ship Kingston	February to May, 1879	Do.
Ship Lochee	March, April, May, July, August, September, and October, 1879	Do.
H. M. S. Magpie	January to December, 1879	Do.
Bark Mertola	January to December, 1879	Do.
Steamship Nizam	February to June, 1879	Do.
Bark Nordenskiöld	May and June, 1879	Do.
Steamship Otranto	December, 1877; and January, February, and March, 1878.	Do.
Pendragon	January and February, 1879	Do.
Steamship Peruvian	August, 1878, to February, 1879, and April, 1879, to January, 1880.	Do.
Bark Queen of Cambria	March, April, May, June, September, October, and November, 1879.	Do.
Light-house tender Richmond.	July, August, and September, 1879, and November, 1879, to March, 1880.	Do.
Royal Alexandria	April and June, 1879	Do.
Schooner A. A. Rowe	June, 1879	
Bark Shun Lee	January, April, May, June, August, September, and October, 1879.	British vessel.
Bark Sophia Joakin	January, February, March, 1879	Do.
Steamship Sorrento	September, 1878, to January, 1879	Do.
Steamship Strathleven	January to June, 1879; September to December, 1879, and January, 1880.	Do.
Steamship Sunbeam	November and December, 1879, and January, 1880	Do.
Bark Syringa	April, 1880	
Theophane	May to August, 1879	British vessel.
Schooner Traveller	April to November, 1879	Do.
German brig W. V. Freeden.	April, May, and August, 1879	
Bark Victoria Cross	December, 1877	British vessel.
Bark Virginia	September and October, 1878, and February, 1879	Do.
Steamship Wyberton	February and March, 1879	Do.
Bark Australia	April 23 to May 19, 1880	Swedish vessel.

List of merchant and naval vessels and naval stations, &c.—Continued.

UNITED STATES NAVAL VESSELS.

Names.	Months for which reports were received.
Adams	April, 1879, to May, 1880, inclusive.
Alaska	May and June, 1879; August, 1879, to February 15, 1880, and March 16 to May 16, 1880.

INTERNATIONAL METEOROLOGY—OCEAN STORM-TRACKS.

PUBLISHED BY ORDER OF THE SECRETARY OF WAR.

Albert J. Myer

BRIG. GEN. (BVT. ASSG'D) CHIEF SIGNAL OFFICER. U. S. A.

Broken or dotted lines indicate that the lines so broken are doubtful.

Arrows, when charted, fly with the wind and exhibit wind-direction.

The tracks charted in black have appeared in previous *Reviews*.

The tracks charted in red have been made from data collected since preceding *Review*.

Office of the Chief Signal Officer,

UNITED STATES ARMY.

Charted from Actual Observations taken Simultaneously, Series commencing September, 1877.

No. V.

		hour.	second.
⟶	1, 2	0 to 9	0 to 4.0
⟶	3, 4	9.1 to 22.5	4.1 to 10.1
⟶	5, 6	22.6 to 40.5	10.1 to 18.1
⟶	7, 8	40.6 to 67.5	18.1 to 30.2
⟶	9, 10	67.6 up	30.2 & over.

INTERNATIONAL MONTHLY CHART.

Showing mean pressure, mean temperature, mean force and prevailing direction of winds at 7·35 A. M., Washington mean time. for the month of May, 1878, based on the daily charts of the International Bulletin.

ISOBARS AND ISOTHERMS.

Isobars in *blue*; detached barometer **means** in English inches.

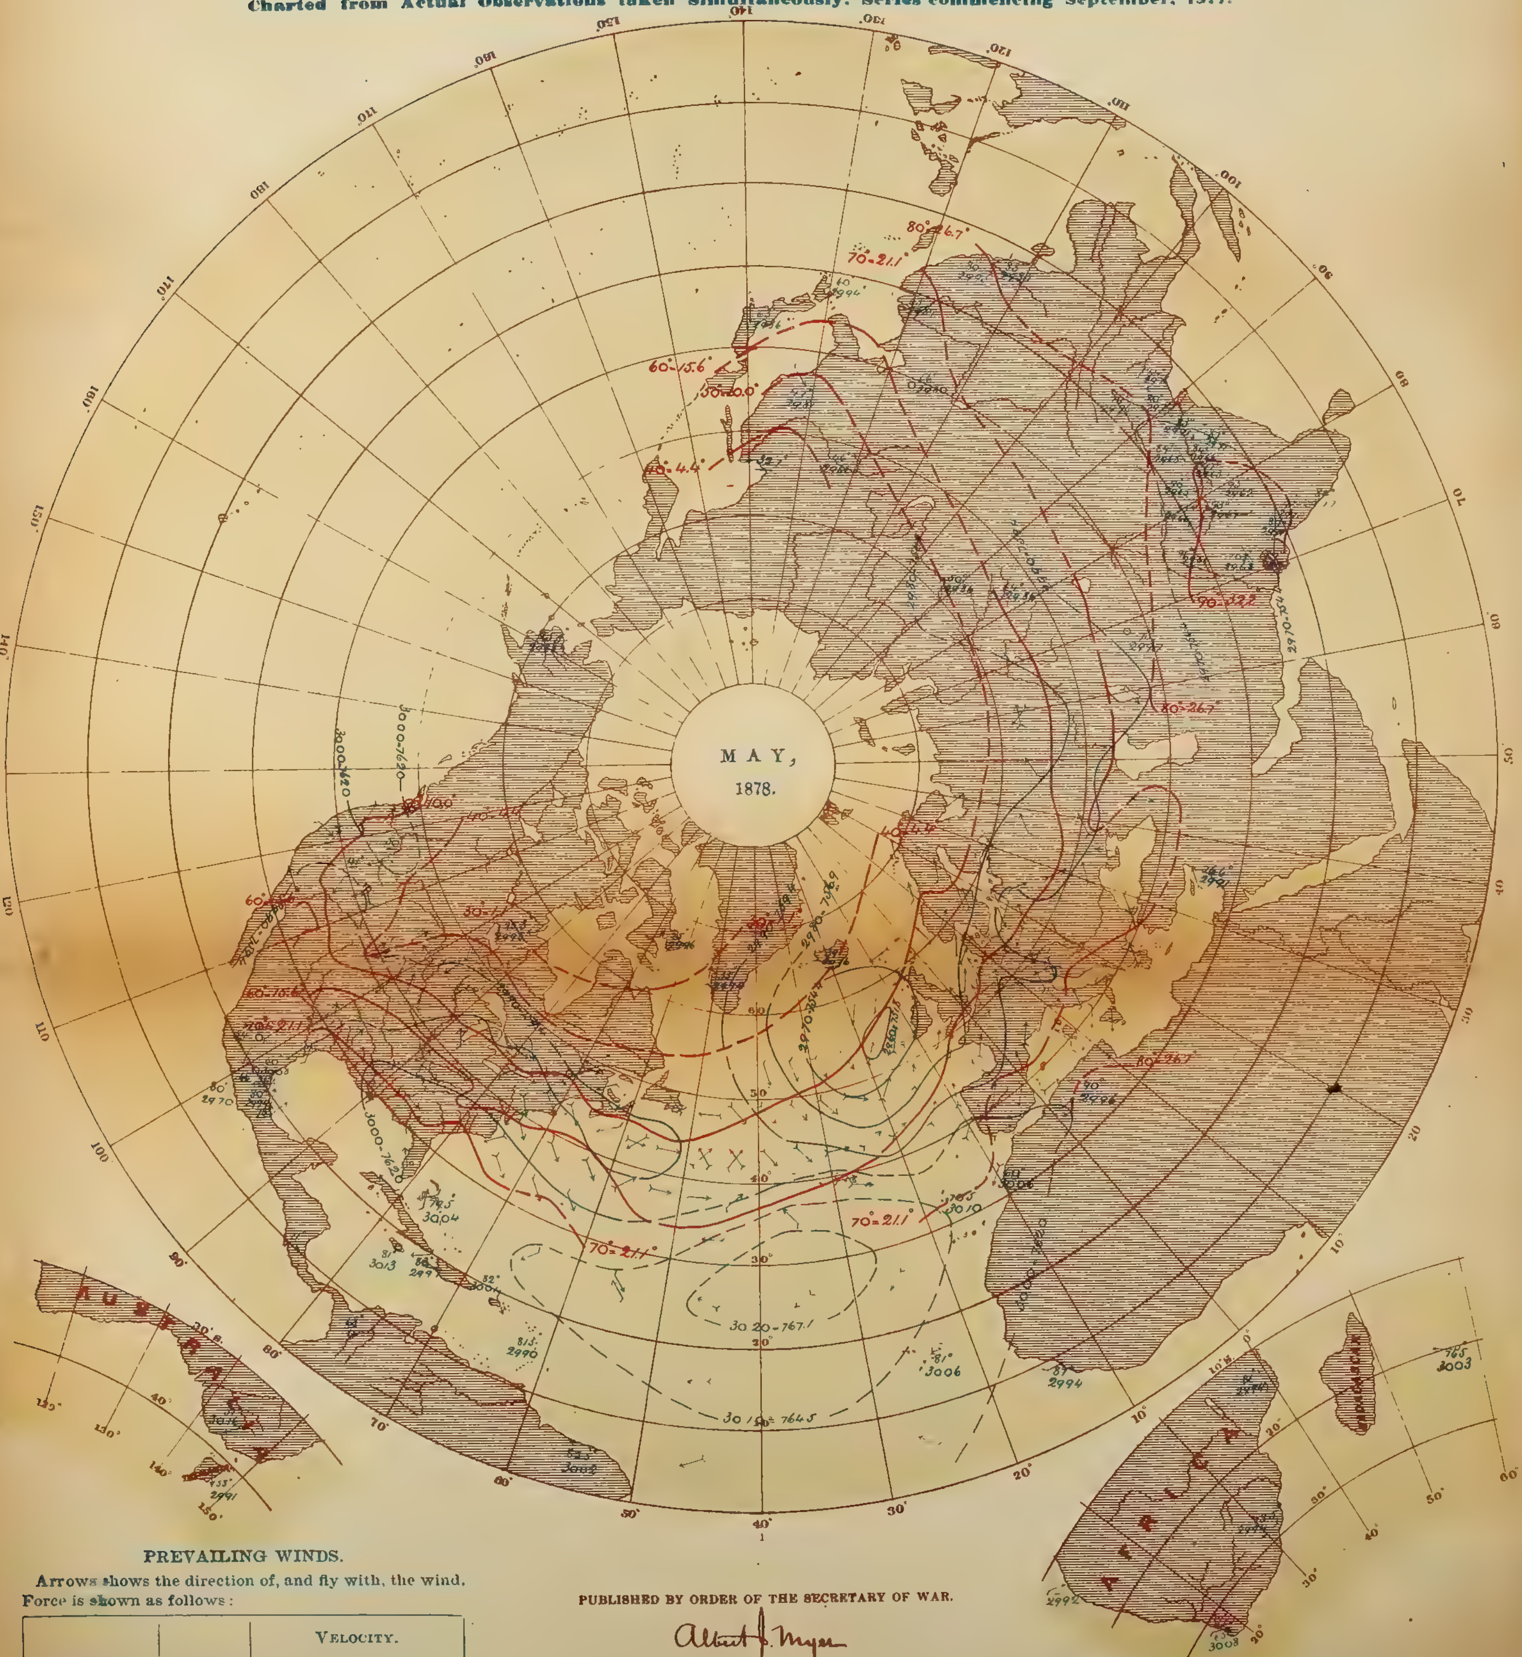
Isotherms in *red*; detached temperature **means** in degrees Fahrenheit.

Office of the Chief Signal Officer,

UNITED STATES ARMY.

Charted from Actual Observations taken Simultaneously. Series commencing September, 1877.

No. V.



PREVAILING WINDS.

Arrows shows the direction of, and fly with, the wind. Force is shown as follows:

PAPER 27.

Bulletin of international meteorological observations, taken simultaneously on June 8, 1880.

7.35 a. m., Washington mean time.
2.12 a. m., Honolulu mean time.
6.7 a. m., Mexico mean time.
7.7 a. m., San José mean time.
7.25 a. m., Toronto mean time.
9.2 a. m., Paramaribo mean time.
0.6 p. m., Lisbon mean time.
0.28 p. m., Madrid mean time.
0.43 p. m., Greenwich mean time.
0.53 p. m., Paris mean time.
1.1 p. m., Brussels mean time.
1.4 p. m., Utrecht mean time.
1.13 p. m., Berne mean time.
1.26 p. m., Christiana mean time.
1.33 p. m., Copenhagen mean time.
1.33 p. m., Rome mean time.
1.37 p. m., Berlin mean time.
1.49 p. m., Vienna mean time.
1.55 p. m., Stockholm mean time.
1.57 p. m., Capetown, C. G. H., mean time.
2.18 p. m., Athens mean time.
2.39 p. m., Constantinople mean time.
2.44 p. m., St. Petersburg mean time.
4.33 p. m., Mauritius mean time.
6.36 p. m., Calcutta mean time.
8.49 p. m., Zi-ka-wei mean time.
10.2 p. m., Tokei (Yeddo) mean time.
10.23 p. m., Melbourne mean time.

(On and after January 1, 1881, the times for simultaneous international meteorological observations will be 35 minutes earlier than the above; meanwhile any such earlier observations will be published with a §.)

ALGERIAN SERIES.

[Furnished by the co-operation of General Maritz, Commandant Supérieur du Génie in Algeria.]

NOTE.—The originals occasionally give the weather by the Vienna symbols or in general terms, but it is not always certain that they refer to the moment of simultaneous observation. The distinction between upper and lower clouds is not made. The rainfall is measured at Vienna at 2 p. m., local time; at Lemberg at 7 p. m., local time; at Trieste at 7 a. m., of the following day. The elevation of Gratz is 357 meters, or 1,171 feet; Hermannstadt, 411.6 meters, or 1.350.4 feet; Kremsmünster, 384 meters or 1,260 feet. At Eperies the observations have been taken at 2, instead of 2.8 p. m., local time.

BELGIAN SERIES.

[Furnished by the co-operation of J. C. Houzeau, Director of the Royal Observatory at Brussels.]

Arlon	......	......	......	......	......	......	....	......	......	......	....	......	......	......	......	......	......	......	Prof. M. Passau.

North Unst, Shetland I's			29. 46	748. 3				N.			6	10	8	Calm.		0	0		Robert Burnet.

NOTE.—Generally, the originals do not give the relative humidity, rainfall or distinction between upper and lower clouds. They give the wind direction to 32 points; the weather by the Beaufort notation; the barometer for Cardington, Galway, Oxford, Sandwick, Leith, Monach, and North Unst as read off; Freetown reduced to freezing, but not to sea-level.

* Second barometer is corrected for index error, but the first is not. The wind-force is given by the scale 0 to 12 in the official series, and by 0 to 6 in the subseries, except in pounds per square foot for Greenwich and Hobart Town. The rainfall is measured at Bradford at 9 a. m.; Hobart Town, 7.30 a. m.; Nottingham, 6 p. m.; Mauritius, 9 a.m.; and on the following day at Aberdeen at 10 a. m.; Helston, 9 a. m.; Sheffield, 8 a. m. The elevation of Fort Napier is 2,200 feet, or 670 meters.

‖ These observations are taken at 1 h. 9 m., instead of 12 h. 43 m., p. m., Greenwich time.

BRITISH MARINE SERIES.															Sea or swell.			
Vessels.															Height scale 0-9	Direction from—

S. S. Richmond																		Capt. W. H. Stuart.
Bark Royal Alexandra																		Capt. W. P. Hughes.
S. S. Strathleven																		Capt. C. W. Pearson.
S. S. Sunbeam																		Capt. C. M. Dobson.

NOTE.—The originals give the wind directions to 32 points, which have been corrected for magnetic variation at this office when necessary; the force by the Beaufort scale 9 to 12; the distinction between upper and lower clouds is made as to direction, but not as to amount; the height of sea-disturbance by the scale 0 to 9; weather by the Beaufort notation. The barometers and thermometers used on these vessels have generally been carefully compared with English standards and corrected.

Bulletin of international meteorological observations, taken simultaneously on June 8, 1880—Continued.

COSTA RICA SERIES.

(By authority of the Minister of Foreign Affairs.)

[Furnished by the co-operation of Señor Federico Maison, Director of the Central Office of Statistics and Meteorology.]

NOTE.—The originals give the wind-force by the scale 0 to 6, except Mont-Louis, Perpignan, and Zi-Ka-Wei, in meters per second; the rainfall as measured at 9 a. m., local times, except Toulouse at 7 a. m., and Lyons, Pic du Midi (Plantade), Fort de France, and Zi-Ka-Wei at the moment of simultaneous observation; clouds on the scale 0 to 4 for Clermont-Ferrand, Commune de Gréasque, and Puy de Dome, the rest on the scale 0 to 10, or in general terms, from which the amount of cloudiness is inferred; no distinction between upper and lower clouds; weather occasionally by Vienna symbols for Mont-Louis and Perpignan, but otherwise in general terms. At St. Maur the observations have been taken at 1.00 instead of 0.53 p. m., local time. The elevation of Clermont-Ferrand is 388 meters, or 1,273 feet; Commune de Gréasque, 322 meters, or 1,056 feet; Mont-Louis, 1,586.40 meters, or 5,264.8 feet; Pic du Midi (Plantade), 2,366 meters, or 7,763 feet; Pic du Midi (Summit), 2,877 meters, or 9,439 feet; Puy de Dome (Summit), 1,467 meters, or 4,813 feet; Tarbes, 308.41 meters, or 1,032.97 feet. In correcting the Mont-Louis barometric observations for altitude the constant, 133 millimeters or 5.24 inches, has been added.

NOTE.—The elevation of Friedrichshafen is 413.3 meters, or 1,356.0 feet; Munich, 528.5 meters, or 1,405.9 feet; Weissenburg, 431 meters, or 1,414 feet. In the originals the distinction between the amount of upper and lower clouds is not made; the wind-force at Carlsruhe is given by the scale 0 to 4. Except for Munich, it is not certain that the rainfall has been measured at, or that the remarks in the weather column refer to, the moment of simultaneous observation. At Königsberg observations have been taken at 2.0, instead of 2.5 p. m.; Memel, 2.1, instead of 2.7 p. m.; Posen, 2.0, instead of 1.51 p. m., local time.

GREEK SERIES.

[Furnished by the co-operation of Prof. Dr. J. F. Julius Schmidt, Director of the Royal Observatory at Athens.]

NOTE.—The barometric observations refer to the Calcutta standard, which is believed to read 0.011 inch, or 0.28 millimeters higher than the Kew standard. All conversions are published as given in the originals, where the data are recorded to an additional decimal; the weather is given by the Beaufort notation, Vienna symbols, or special symbols; the distinction between the amount of upper and lower clouds is apparently not made. The elevation of Poona is 1,848.2 feet, or 563.3 meters; Belgaum, 2,550 feet, or 777 meters; Nagpur, 1,025 feet, or 312 meters; Hazaribagh, 2,010 feet, or 613 meters; Jubbulpore, 1,351 feet, or 412 meters. The velocity given is the average rate of wind since observation of the preceding day.

NOTE.—The originals give the amount of cloudiness by the scale 0 to 4, except Bogota, Paramaribo, and York Factory. The elevations of the barometers are, at Atlanta, 1,131.3 feet, or 344.8 meters; Bismarck, 1,704.3 feet, or 519.5 meters; Boerne, 1,333 (?) feet, or 406 (?) meters; Bogota, 8,717.9 feet, or 2,657.2 meters; Boise City, 2,877 (?) feet, or 877 (?) meters; Brackettville, 1,026 (?) feet, or 313 (?) meters; Campo, 2,500 (?) feet, or 762 (?) meters; Cheyenne, 6,057.3 feet, or 1,846.2 meters; Coleman City, 1,727 (?) feet, or 526 (?)meters; Concho, 1,750 (?) feet, or 533 (?) meters; Deadwood, (?); Decatur, 1,160 (?) feet, or 354 (?) meters; Denver, 5,269 feet, or 1,606 meters; Dodge City, 2,486 feet, or 757 meters; Florence, 1,550 (?) feet, or 472 (?) meters; Fort Custer, (?); Fort Davis, 5.203 (?) feet, or 1,586 (?) meters; Fort Elliot, 2,500 (?) feet, or 762 (?) meters; Fort Grant, 4,823 (?) feet, or 1,470 (?) meters; Fort Griffin, 1,270 (?) feet, or 387 (?) meters; Fort McKavett, 2,050 (?) feet, or 625 (?) meters; Fort Sill, 1,100 (?) feet, or 335 (?) meters; Fredericksburg, 1,614 (?) feet, or 492 (?) meters; Jacksboro', 1,119.2 (?) feet, or 341.1 (?) meters; Mason, 1,800 (?) feet, or 549 (?) meters; Mount Washington, 6,285 feet, or 1,916 meters; North Platte, 2,838.2 feet, or 865.1 meters; Omaha, 1,077.4 feet, or 328.4 meters; Phœnix, 1,800 (?) feet, or 549 (?) meters; Pike's Peak, 14,150.7 feet, or 4,313.1 meters; Pioche, 5,778.6 (?) feet, or 1,761.3 (?) meters; Prescott, 5,700 (?) feet, or 1,737 (?) meters; Salt Lake City, 4,362.2 feet, or 1,329.5 meters; Santa Fé, 6,851 (?) feet, or 2,088 (?) meters; Silver City, 6,896 (?) feet, or 2,102 (?) meters; Socorro, 4,064 feet, or 1,239 meters; Stockton, 3,100 (?) feet, or 945 (?) meters; Tucson, 2,542 (?) feet, or 775 (?) meters; Virginia City, 5,480 (?) feet, or 1,670 (?) meters; Wickenburg, 2,050 (?) feet, or 625 (?) meters; Winnemucca, 4,335.3 feet, or 1,321.4 meters; Yankton, 1,275 feet, or 389 meters. The following constants are added to the barometer readings as approximate reductions for altitude above sea-level: Bismarck, 1.856 inches, or 47.14 millimeters; Boise City, 2.96 inches, or 75.2 millimeters; Campo, 2.57 inches, or 65.3 millimeters; Cheyenne, 5.94 inches, or 150.9 millimeters; Denver, 5.22 inches, or 132.6 millimeters; Florence, 1.60 inches, or 40.6 millimeters; Fort Davis, 4.96 inches, or 126.0 millimeters; Fort Grant, 4.800 inches, or 121.9 millimeters; Fort Verde, 3.488 inches, or 88.6 millimeters; La Mesilla, 4.15 inches, or 105.4 millimeters; Mount Washington, 6.36 inches, or 161.5 millimeters; Pike's Peak, 12.21 inches, or 310.1 millimeters; Pioche, 5.77 inches, or 146.6 millimeters; Prescott, 5.36 inches, or 136.1 millimeters; Salt Lake City, 4.33 inches, or 110.0 millimeters; Santa Fé, 6.54 inches, or 166.1 millimeters; Stockton, 3.00 inches, or 76.2 millimeters; Tucson, 2.59 inches, or 65.8 millimeters; Wickenburg, 2.09 inches, or 53.1 millimeters; Winnemucca, 4.36 inches, or 110.7 millimeters; Virginia City, 5.48 inches, or 139.2 millimeters. || The correction of the barometer for temperature is uncertain, but is assumed to be the same as for brass scales.

Bulletin of international meteorological observations, taken simultaneously on June 8, 1880—Continued.

UNITED STATES NAVAL SERIES.

NOTE.—With some exceptions, the originals give the barometer as read off; wind and weather by the Beaufort scales; no distinction between upper and lower clouds. The elevation of naval hospital at Yokohama is 115 feet, or 35 meters, for which the constant reduction is 0.125 inches, or 3.18 millimeters.

*The error of barometer is not known.

†Aneroid.

NOTE.—With some exceptions, the originals give the barometer as read off; wind and weather by the Beaufort scales; no distinction between upper and lower clouds.

Collated at the office of the Chief Signal Officer of the Army, Washington, D. C.

The records which appear in this bulletin are copied from the regular exchanges of this office, made in each instance in compliance with a special request, and are published for the uses of the co-operating observers.

The barometric readings in the first two columns are reduced to freezing and their respective standards; those in the second two also to mean sea-level. For all naval and marine series the correction for instrumental error and the reduction to sea-level have been applied whenever they could be ascertained by means of reliable comparisons, made when the vessel was at or near land stations. When rain has fallen, but neither amount nor duration is recorded, the word "Blank" is published in the rainfall column. The "weather" is generally published as given: D. clouds, for detached clouds. When the distinction between the upper and lower strata of clouds is not reported, the *kinds* or *types*, viz, cirrus, cumulus, stratus, nimbus, scud, fracto, pallio, haze, fog, and smoke, as indicated, respectively, by the letters c, k, s, n, d, f, p, hz, fg, and sm'e, are generally published with the amount in the lower-cloud column. The distinction between the upper and lower strata is carefully made in the United States series and a portion of the Canadian series, and the types are indicated by the above letters and their combinations in the proper column.

R. C. DRUM,
Adjutant-General, and Acting Chief Signal Officer of the Army.

PAPER 28.

List of military posts from which meteorological reports have been received monthly at the office of the Chief Signal Officer during the year ending June 30, 1880.

Post.	State.	Post.	State.
Abraham Lincoln, Fort	Dakota.	Madison Barracks	New York.
Adams, Fort	Rhode Island.	McDermit, Fort	Nevada.
Alcatraz Island	California.	McDowell, Fort	Arizona.
Angel Island	Do.	McHenry, Fort	Maryland.
Apache, Fort	Arizona.	McKavett, Fort	Texas.
Assinniboine, Fort	Montana.	McPherson, Fort	Nebraska.
Barrancas, Fort	Florida.	Mojave, Fort	Arizona.
Benicia Barracks	California.	Monroe, Fort	Virginia.
Brady, Fort	Michigan.	Meade, Fort	Dakota.
Benton, Fort	Montana.	McPherson Barracks	Georgia.
Bidwell, Fort	California.	Niagara, Fort	New York.
Bliss, Fort	Texas.	Niobrara, Fort	Nebraska.
Boise, Fort	Idaho.	Pembina, Fort	Dakota.
Bowie, Fort	Arizona.	Plattsburg Barracks	New York.
Brown, Fort	Texas.	Point San José	California.
Buford, Fort	Dakota.	Porter, Fort	New York.
Bridger, Fort	Wyoming.	Preble, Fort	Maine.
Canby, Fort	Washington Ter.	Presidio, San Francisco	California.
Columbus, Fort	New York.	Pagosa Springs Cantonment	Colorado.
Colville, Fort	Washington Ter.	Randall, Fort	Dakota.
Concho, Fort	Texas.	Rice, Fort	Do.
Cœur d' Alene, Fort	Idaho.	Ringgold, Fort	Texas.
Davis, Fort	Texas.	Rock Island Arsenal	Illinois.
Douglas, Fort	Utah.	Sanders, Fort	New York.
Duncan, Fort	Texas.	Shaw, Fort	Montana.
Ellis, Fort	Montana.	Sheridan, Camp	Nebraska.
Elliott, Fort	Texas.	Sidney, Fort	Do.
Fetterman, Fort	Wyoming.	Sill, Fort	Indian Territory.
Fred Steele, Fort	Do.	Sisseton, Fort	Dakota.
Garland, Fort	Colorado.	Snelling, Fort	Minnesota.
Gaston, Fort	California.	Stevenson, Fort	Dakota.
Grant, Fort	Arizona.	Saint Augustine	Florida.
Griffin, Fort	Texas.	Sully, Fort	Dakota.
Hale, Fort	Dakota.	Stevens, Fort	Oregon.
Halleck, Fort	Nevada.	Totten, Fort	Dakota.
Hamilton, Fort	New York.	Townsend, Fort	Washington Ter.
Harney, Fort	Oregon.	Union, Fort	New Mexico.
Hartsuff, Fort	Nebraska.	Verde, Fort	Arizona.
Hays, Fort	Kansas.	Walla Walla, Fort	Washington Ter.
Hall, Fort	Idaho.	Wallace, Fort	Kansas.
Keogh, Fort	Montana.	Warren, Fort	Massachusetts.
Klamath, Fort	Oregon.	Wayne, Fort	Michigan.
Lapwai, Fort	Arizona.	West Point Military Academy	New York.
Leavenworth, Fort	Kansas.	Whipple Barracks	Arizona.
Logan, Fort	Montana.	Willet's Point	New York.
Lowell, Fort	Arizona.	Wingate, Fort	New Mexico.
Lyon, Fort	Colorado.	Washakee, Fort	Wyoming.
Lewis, Fort	Do.	Yuma, Fort	California.

PAPER 29.

List of voluntary observers who have forwarded monthly reports to the Chief Signal Officer during the year ending June 30, 1880.

Name of observer.	Post-office address.	State.
Abbott, Dr. E. K	Salinas City	California.
Adriance, Charles E	Hector	New York.
Allbree, George	Pittsburgh	Pennsylvania.
Allan, W. T.	Geneseo	Illinois.
Alden, Lyman P	State School, Coldwater	Michigan.
Allen, Lucius C	Springfield	Massachusetts.
Allison, Dr. John A	Statesville	North Carolina.
Altaffer, J. M	Independence	Kansas.
Amos, Franklin	Ringgold	Ohio.
Anderson, Rev. John	Clarksville	Texas.
Andrews, George W	Williamstown	Massachusetts.
Andrews, Lurman	Southington	Connecticut.
Andrew, Thomas B	Garrison's	New York.
Armstrong, Rev. G. C	Fayette	Mississippi.
Ashby, M. V	Afton	Iowa.

List of voluntary observers, &c.—Continued.

Name of observer.	Post-office address.	State.
Annis, Prof. F. J	State Agricultural College, Fort Collins	Colorado.
Aber, C. K	Williamstown	Massachusetts.
Bateman, J. H	Dover	Delaware.
Barringer, William	Bellefontaine	Ohio.
Blanchard, O. A	Elmira	Illinois.
Bryant, A. F	Clear Creek	Nebraska.
Bartlett, E. B	Vermillion	New York.
Baker, D. W. C	Austin	Texas.
Bayliss, Rachel H	Independence	Kansas.
Brainerd, H. G	Independence	Iowa.
Bradley, W. R	Georgetown	Colorado.
Blake, D. G	Calvistogu	California.
Ballard, Dr. F. A	Independence	Missouri.
Beebe, Levi	South Lee	Massachusetts.
Beans, Thomas J	Moorestown	New Jersey.
Breed, J. E	Embarrass	Wisconsin.
Beal, William	Murphey	North Carolina.
Bell, Joseph	Franklin	Pennsylvania.
Beall, Dr. and Mrs. R	Lenoir	North Carolina.
Brendell, Fred	Peoria	Illinois.
Beloit College	Beloit	Wisconsin.
Benedictine Fathers	Saint Meinrad	Indiana.
Brewster, James	Okalooska	Louisiana.
Bently, David	Princeton	California.
Beatty, Dr. George F	Paloa	Kansas.
Bien, Morris	Eureka	Nevada.
Briggs, John	Albany	Oregon.
Breedon, Jacob	Adrian	Michigan.
Bowman, Peter	Savannah	Ohio.
Boerner, Prof. Charles	Vevay	Indiana.
Blodgett, Charles	Howard	Nebraska.
Blood, Charles F	Waltham	Massachusetts.
Blood, Charles F	Windsor	Vermont.
Bower, Dr. William W	Mount Sterling	Illinois.
Brown, C. C	Cape Vincent	New York.
Boies, A. H	Hudson	Michigan.
Boone, C. A	Orlando	Florida.
Bullard, R	Litchfield	Michigan.
Bullock, Thomas	Coalville	Utah.
Byrant, A. F	Clear Creek	Nebraska.
Clarke, Dr. J. T	Mount Solon	Virginia.
Crane, George W	Bethel	Ohio.
Chase, Dr. D. H	Louisville	Illinois.
Clark, T. A	Weldon	North Carolina.
Chappelsmith, John	New Harmony	Indiana.
Caldwell, John W	Clarksville	Tennessee.
Carlovitz, John	Milton	Florida.
Clark, J. Morton	Arlington	Indiana.
Caulkins, John S	Thornville	Michigan.

PAPER 30.

(Circular.)

THE WEATHER CASE, OR FARMERS' WEATHER INDICATOR.

DESCRIPTION.

Stand facing and look at the weather case. Now:

The right of the case is at your right hand; the left of the case is at your left hand.

The pointer or index at the top of the case (No. 1) slides on the brass arc; it is known as the "sunset barometer index," and indicates, when set, by the figures to which it points on the "main barometer scale," which is just below it, the reading of the barometer at the time of the sunset yesterday.

The "main barometer scale" (No. 2) exhibits all the barometric readings likely to be used with this instrument.

The pointer (No. 3) just below the "main barometer scale" is called the "reference index," and indicates by the figures to which it points on the main barometer scale, when the instrument is set, the mean or average reading of the barometer at the *place* at which the instrument is set and for each separate *month*. When the barometer reads above or below this reading at any place, such reading is said be "above the mean" or "below the mean" for that place in that month. This reference index is established in the exact central line of the face of the case.

The barometer and the main barometer scale are set to the reference index once for each month in the year, as follows:

The mean or average reading for the place and for the month, appearing on the scale marked on the barometer face, must be adjusted to coincide exactly with the reference index. To do this, the *mean barometer reading for the place and for the month* being first ascertained, the figures or divisions for that reading are found upon the scale of figures and divisions marked on the barometer face. The barometer is then revolved upon its horizontal axis by the hand-screw, to be found behind, or at the back of, the weather case, until these figures (*those for the proper reading for the month*) are adjusted to the lower point of the "reference index," as near to it as possible. This lower point is the point seen inside and at the top of the barometer case.

The main barometer scale (No. 2) is then turned by the thumb-screw A until the same proper mean reading for the month appearing upon that scale is adjusted to the upper point of the reference index.

The long brass hand over the glass face of the barometer is known as the "long pointer," and indicates, by the figures of the "main barometer scale" to which it points when set, the reading of the barometer when last set.

The black pointer on the face of the barometer under the glass face is known as the "short pointer," and indicates the existing pressure of the atmosphere at any time the instrument may be examined.

ILLUSTRATION.

For instance: Suppose for the month of February, and at the city of Washington, the mean or average barometer reading is 30.02, then the barometer face is turned by the hand-screw until the barometer reading 30.02, as near it as possible, is at the lower point of the reference index. The main barometer scale is turned by the thumb-screw, A, until the same reading (30.02) on that scale is at the upper point of the reference index, as near to it as possible. (See plate herewith.)

The barometer and the main barometer scale are now so arranged that when either the short pointer or long pointer, after being adjusted, is found to be pointing to the *right* of the reference index, it is at once and readily known that the barometer reading is above or higher than the mean barometer reading for the month.

When either the short pointer or long pointer, after being adjusted, is found to be pointing to the *left* of the reference index, it is readily known that the barometer reading is below or lower than the mean barometer reading for the month.

The instrument can in this way be easily observed: when so arranged it is described as "set to the reference index."

The reference index, when the instrument is thus set, indicates the mean or average reading of the barometer at the place at which the instrument is set and for each separate month.

As long as the barometer pointers at any time go towards the right the barometer is said to be "rising." As long as the barometer pointers go toward the left the barometer is said to be "falling."

When the barometer pointers go toward the right from the mean barometer reading at the reference index, the barometer is said to be "high and rising." When the barometer pointers go toward the left from the mean barometer reading at the reference index, the barometer is said to be "low and falling."

The barometer pointers may remain stationary. The barometer is, for such time, said to be "stationary."

Directions for procuring the mean barometer reading (actual) for each district for each month, with close approximation, can be had by application to this office.

A barometer reading ought always to be carefully taken and recorded at sunset each day, at each place, to enable a monthly mean for that place to be arrived at.

TO READ THE BAROMETER.

If the observer stands facing the barometer, the "short pointer" (black) moves toward the right as the pressure of the atmosphere (or weight of the air) increases, and to the left as the pressure of the atmosphere (or weight of the air) diminishes. The "long pointer" (brass) should be moved by the turning screw so as to coincide with, or exactly cover, the "short pointer" (black). The barometer is now set for reading, and the "barometer reading" is found by reading from the left to right on the "main barometer scale," from the lowest figures (or readings) on that scale to that exact division or mark upon that scale to which the "long pointer" points or which it covers. The inches and hundredths of inches are marked on the scale. The inches and hundredths are counted from left to right, or in the same direction as the hands of a watch move, and they are counted in the same way as the hours and minutes on a watch-face are counted. The inches and hundredths are written down, if they are to be written, in the same manner as dollars and cents are written, thus: one dollar and seventy-five cents; that is, one dollar seventy-five hundredths of a dollar would be written 1.75, or one and seventy-five hundredths; $29.35, twenty-nine dollars and thirty-five hundredths. The "long pointer" pointing on the "main barometer scale" to twenty-nine inches and thirty-five hundredths, the barometer reading would be twenty-nine inches and thirty-five hundredths of an inch, and would be written "29.35 inches," and so for other readings.

RAIN WINDS AND DRY WINDS.

There are for each place and each month two kinds of winds:

First. Winds which, blowing from certain directions, are at that place and in that month more likely than other winds to be followed by rain. These are called "rain winds."

Second. Winds which, blowing from certain directions, are at that place and in that month less likely than other winds to be followed by rain. These are called "dry winds."

The "rain winds" and the "dry winds" for each district and for each month are stated in the Farmers' Bulletin, or can be had by application to this office.

The wind direction for any day or time must be seen and taken at each place or station by a vane as well located as practicable.

The "wind disk" (No. 8) consists of a brass circle, on which slide freely two arcs—a red arc, called the "dry wind arc" (No. 9), and a blue arc, called the "rain wind arc" (No. 11). In the center of the disk is a pointer turning with a turning-screw, and called the "wind disk pointer" (No. 10). Around the disk are letters to show directions, as N. for north, E. for east, NE. for northeast, &c.

The wind disk is made ready for use as follows: If, for instance, the Farmers' Bulletin, or other report, states that, for any district or place, and for any month, "winds blowing from south and east, or from directions between those points, are found to be the winds most likely to be followed by rain; winds blowing from north or west, or from directions between those points, are found to be the winds least likely to be followed by rain;" or, in other words, "winds blowing from east or south, or from directions between those points, are rain winds; winds blowing from north or west, or from directions between those points, are dry winds;" then, if the instrument is to be used in that month and in that district or place, the rain wind arc No. 11 (the blue) is moved on the brass circle until one end of the arc is at the letter E., which stands for "east," and the other is at the letter S., which stands for "south;" the dry wind arc No. 9 (the red) is moved on the circle until one end of that arc is at the letter N., which stands for "north," and the other is at the letter W., which stands for "west." The arcs remain as they are thus placed for the whole of the month.

At the beginning of the next month, the rain-wind direction and dry-wind direction must be located for that month, and the arcs must be again moved on the circle in the same manner, until the rain-wind arc and the dry-wind arc touch, respectively, with their ends, the letters for the points named for the rain-winds and the dry-winds for that month. The arcs then remain so placed for that month; so for each month of the year.

Now, when the wind disk is thus ready, and on any day, the weather case is to be used. (1) The direction in which the wind is blowing is seen by a vane. It is noticed from what direction the wind is blowing, as from the north, south, east, &c. (2) The wind disk pointer (No. 10) is moved by the turning-screw to point to the compass letters on the disk, or between them, showing as nearly as practicable by those letters the same direction *i. e.*, that *from* which the wind is blowing when observed. If the pointer, so set, points at either of the ends of either arc, or any part of either arc, it shows, if it so points at the *red* arc, that the wind is at that time in the *dry*-wind direction or is a *dry*-wind; if it so points at the *blue* arc, that the wind is at that time in the *rain*-wind direction or is a *rain*-wind.

The hour is noted by a clock or watch and the time at which a rain-wind or a dry-wind commenced to blow or was first noticed is written down.

It must be also noticed if the wind shifts, as from blowing from a rain direction to blowing from a dry direction, or is blowing from such direction as not to be within either arc.

The length of time for which the wind has blown continuously from a rain direction or a dry direction is of importance, to be considered with other local signs and indications.

The pointer and scale (No. 5) on the right of and below the barometer are called the dry-wind time record, and the pointer (No. 7) is called the "record pointer," and indicates, when set, the length of time the wind has been blowing continuously from a "dry" direction, by the figures showing the number of hours on the scale to which it points.

The pointer and scale (No. 4) on the left of and below the barometer are called the rain-wind time record, and the record pointer (No. 6) indicates, when set, the length of time the wind has been blowing continuously from a "rain" direction, by the figures showing the number of hours on the scale to which it points.

The record pointer on the rain-wind time record (No. 6) is always turned by the thumb-screw, and set pointing at the figure 0 on the scale when the wind is not blowing in the rain-wind direction. In the same way the "record pointer" on the dry-wind time record (No. 7) is always set pointing at the figure 0 when the wind is not blowing in the dry direction.

When in actual use, the hour at which the *wind-disk pointer* has been set is carefully noted. When the weather case is next examined, the wind-vane is again noticed and the wind-disk pointer again *examined* or adjusted. If it still continues to point at any part of the same arc as before, the number of hours which have elapsed since the last setting and during which the wind-disk pointer has been so pointing is noticed, and the record pointer on either the rain-wind time record or dry-wind time record is turned to show *the number of hours* the wind has been thus noticed as blowing from the *rain* direction or from the *dry* direction, as the case may be. This proceeding is repeated every time the instrument is set. It can thus be seen at a glance whether the wind is, or not, blowing in a rain-wind or a dry-wind direction, and for how long it has been so blowing. Whenever, on noticing the wind-vane, it is seen that the wind has shifted, the wind-disk pointer is set accordingly. If it now points at neither arc or points to the different arc from that at which it pointed at its last setting, the time-record pointer on the rain-wind time record or dry-wind time record (whichever may have been in use at the last setting) is turned to point at the figure 0 (zero).

The wind-disk pointer and the time-record pointer ought to be set thrice daily, at least; early in the morning, at noon, and at sunset.

The sunset-disk (No. 12) consists of a circular disk one-half of which is colored red and one-half of which is colored blue. The disk turns upon a central turning-screw in such a manner that half of the disk shows through a semi-circular opening in the face of the weather case. The sunset-disk is set as follows: At the exact time of every sunset the western sky and the character of the sunset is carefully observed. The examination ought to be minute and careful, lasting for about fifteen minutes. If the sunset sky is clear or red, or markedly what is known as a "fair weather sunset"—a sunset such as is generally held to indicate a clear or fair day to follow on the next day—a day on which it will not rain—the sunset disk is turned by the turning screw until the semi-circular opening shows all red. The sunset disk, thus turned, is described as set for a "fair weather sunset."

If the sunset sky (the western) is cloudy or foul, or markedly what is known as a "foul weather sunset," a sunset such as is generally held to indicate foul weather to follow on the next day—a day on which it will rain—the sunset disk is turned by the turning-screw until the semi-circular opening shows all blue. The sunset disk thus turned is described as set for a "foul weather sunset." If the appearance of the western sky and the character of the sunset are neither markedly those of a "fair weather sunset" or of a "foul weather sunset," but such as to leave the observer in doubt how to style it, the sunset disk is turned to show half red and half blue, or "doubtful." The sunset disk, thus set, is described as set for a "doubtful weather sunset."

The term "fair weather sunset" expresses such condition of the sky, particularly the western, and such character of the sunset as is considered to indicate a fair day, a day on which it does not rain, for the day ensuing.

The term "foul weather sunset" indicates that the appearances are such as to presage a rainy day, a day on which rain falls, for the ensuing day.

The term "doubtful weather sunset" indicates that the conditions are such as to leave the mind of the observer in doubt as to what the sunset presages for the following day. The indication is considered to be for the period of time from the "sunset" of the day on which the character of the sunset is examined until the "sunset" of the following day.

DRY-BULB AND WET-BULB THERMOMETERS.

In the lower part of the weather case there are two thermometers, a dry-bulb thermometer (No. 13) on the left-hand side of the case, and a wet-bulb thermometer (No. 14) on the right-hand side.

The dry-bulb thermometer is like any other thermometer, and shows by its readings the temperature of the air.

The wet-bulb thermometer is one the bulb of which is kept constantly moist by the water passing up from the glass reservoir, through the wicking which covers the thermometer bulb.

The readings of the dry-bulb thermometer and those of the wet-bulb thermometer are more and more unlike, or further and further "*apart*," as it is called, in proportion as the air contains less and less moisture; that is, is becoming *dryer*.

The readings of the dry-bulb thermometer and those of the wet-bulb thermometer become more and more *alike*, are nearer and nearer together, in proportion as the air contains more and more *moisture*. That is, is becoming saturated or *wet*.

By the side of the dry-bulb thermometer (No. 13) is the dry-bulb pointer which slides on the brass slide (No. 15). By the side of the wet-bulb thermometer is the wet-bulb pointer which slides on the brass slide (No. 16). In the center of the case is the "dry and wet bulb scale," marked on the paper on which is the central brass slide-bar (No. 19), and on this slide move the dry-bulb keeper (No. 17) and the wet-bulb keeper (No. 18). To set the thermometers, examine first the dry-bulb thermometer and move the "dry-bulb pointer" (No. 15) on the slide until the outside point is exactly level with the top of the mercury in the thermometers—as near to it as practicable. Examine next the wet-bulb thermometer, and move the wet-bulb pointer (No. 16) on the slide until the outside pointer is exactly level with the top of the mercury in the wet-bulb thermometer, or as near to it as practicable; then turn to the dry and wet bulb scale, and on the "central brass slide-bar" (No. 19) move one of the keepers until it touches as nearly as possible—is on an exact level with the inside pointer of the "dry-bulb pointer;" then move the other keeper until it touches, as nearly as practicable—is on an exact level with the inside pointer of the "wet-bulb pointer." The thermometers are now set and the difference between their readings can be known by counting on the "dry and wet bulb scale" the number of degrees between the keepers.

When the thermometers are examined and set again, following the same plan, it will be easily seen whether the "keepers" are, when set, *further apart* than they were at the previous setting, or whether they are, when set, *nearer together* than at the previous setting.

If they are further apart the thermometers are said to be "separating." If they are nearer together the thermometers are said to be "approaching." Other things being equal, the thermometers show, when they are "separating," that the air is becoming more dry—one sign of approaching fair weather. The thermometers show, when they are "approaching," that the air is becoming more moist or damp—one sign of approaching rain.

The reservoir at the bottom of the weather case ought to be kept half filled always with pure water. The wicking must be kept clean and changed occasionally—say, once in each month.

USES OF THE WEATHER CASE.

The weather case is not intended to be used independently of the official weather reports. It is to be used always in connection with them. The weather case is for the purpose of supplementing the official reports by showing the local instrumental indications, and giving other information. It is intended especially for use at farmers' post-offices and places reached with difficulty by the printed reports. It will supplement often whatever knowledge there be of local signs, with the indications of the instruments. Its careful use, taken either with the furnished reports or even without them (if they chance to fail), will often enable the character of the coming weather on the coming day to be so judged as to determine what kind of work or undertaking it is wise to plan for or to omit. The case gives the local instrumental indications, and will frequently aid in making fair forecasts for the next day.

It is well to limit the forecasting to the attempt to tell only whether it will or will not *rain* on the next day. Days on which it does not rain at all are rated "fair," though the sky may be covered with clouds. Days on which there is rain enough to injure crops in the harvesting are rated "foul."

It must never be forgotten that the weather case is only to aid, sometimes, in making up one's mind as to what the weather of the next day will be. While it will often be very useful, there will be many instances in which everything will be left in doubt

LOCATION.

The weather case should be hung or stand in a fair light, where it will be always shaded, preferably on the northern side or part of the house, where it will not be exposed to artificial heat, and where there will be a free circulation of the air. It will be easier to find good locations in summer than in winter. As the readings of the instrument are examined for their general indications only, the great care as to the location will not be so needed for general use as if the readings were for exact record. For particular uses, the case may be particularly sheltered.

TO USE THE WEATHER CASE AT SUNSET.

(1) Read the description. See that the figures or divisions on the barometer face, and also those on the main barometer scale indicating the mean or average barometer reading for the *place* and for the *month*, are set to the reference index as directed on page 1.

(2) Set the rain-wind segment (or arc) and the dry-wind segment (or arc) at the proper places on the wind-disk circle for the place and month.

At sunset turn the "long barometer pointer" until it covers the "short barometer pointer." Note whether on the "main barometer scale" the long pointer is then at a reading *above* or *below* (greater or less than) the mean barometer reading for the place and for the month. Move the "sunset barometer index" until it points to the same reading on the "main barometer scale" with the "long barometer pointer."

Note the direction of the wind and set the wind-disk pointer.

Set the sunset-disk.

Set the dry and wet bulb thermometers.

Endeavor to apply the "indications" printed on the face of the case, to determine what is to be the character of the next day. Read these "indications" carefully, and see how many of the instruments or disks *agree* in showing one or another kind of weather as to be expected.

Study the character of the clouds. The scud cloud is one of the prominent signs of coming rain. Learn to apply the local signs of weather changes, the more the better.

Examine the case frequently during the day.

It can always be found whether the "pointer" is moving toward the right or left—that is, whether the barometer is rising or falling—by turning the long pointer so as to cover exactly the black barometer pointer; if then, on next examination, the black pointer is found to have moved toward the right, the barometer is rising. If the black pointer has moved toward the left, the barometer is falling.

At sunset of the next day set the case again; note whether the barometer has risen since the "sunset barometer index" was set at the last sunset, whether the wind is in the rain or dry direction, and for how many hours it has been in either, approximately. Study and record the character of the sunset and what it foretells. Set the wet and dry bulb thermometer, and note from the "keepers" whether the thermometers are approaching or separating.

Endeavor to make a forecast whether it WILL OR NOT rain for the ensuing day, as well as a more general forecast.

For instance, if, with a "fair weather sunset," there is a "high and rising barometer," "winds in dry direction," and "thermometers separating," the chances for a fair day for the next ensuing are increased; four indications of pleasant weather coincide. If, with a "foul weather sunset," the barometer is "falling" (the pointer moving toward the left), the winds are in the rain-wind direction and "thermometers approaching"; four indications of rainy or unpleasant weather coincide. So, three indications may coincide, as, with "thermometers approaching" there may be "fair weather sunset"—barometer pointer moving toward the right or high barometer—wind steady in the dry direction. The indications may be divided. In such cases weight must be given the different indications as experience may show their correctness. The purpose of the case is to be one aid only in making up a forecast.

The greater the number of the "indications," as stated on the face of the case, which are found, when the instrument is set, to coincide in indicating dry or clear weather or rainy or stormy weather, the more likely the success of the forecast.

Continue this practice at sunset from day to day. Skill will be found to increase with the knowledge and the use of the instruments and the habit of close observation of local signs which such use makes necessary.

In instances where the printed synopses and indications are had regularly, or where official weather charts, bulletins, &c., can be consulted, the weather case must be used with careful study of those papers. Locate the areas of high and low barometer on the map, and in reference to any location, as nearly as is practicable from the descriptions or date. Areas of cloudiness, rain-areas, areas of unusual temperatures, &c., may be similarly located. When any such areas are found to the westward of and at all near any place, it is rare that the effects of them fail to be shown at such place by weather conditions similar to those within the areas noticed, and in a short time, as of hours or days. As the movements of the areas—easterly—have a certain regularity, it is soon learned to tell nearly *when* the effect of any area noticed as approaching will commence to be felt. The instrumental signs of the weather case will show the changes commencing, and it may be judged whether or when the weather conditions noticed in the approaching area are likely to prevail. Some elementary knowledge of meteorology is needed; but much can be done by a careful watching solely. The instruments of the weather case will show the changes anticipated when they begin to be felt, and before they have arrived, in their full force.

If the area noticed has been large or small, with weather conditions decided or variable, it can, from these facts, be judged often if the "coming weather," of whatever kind it may be, will be steady for a day or for days, or more rapidly changing. The case makes practicable other and many studies.

—— ——,
Operator.

NOTE.—Under the head of remarks will be noted all delays in the prompt receipt of the dispatch, with cause of delay, when known. One copy of this form will be mailed at the close of each fortnight to the Chief Signal Officer, U. S. A., Washington, D. C.

(Indorsed:) Form 29. Report of railway bulletins for the fortnight ending —— 188—, station ——. Rec'd O. S. C. O. ——, 188—.

PAPER 33.

MONTHLY WEATHER REVIEW, JULY, 1879.

INTRODUCTION.

In preparing this Review the following data, received up to August 13th, have been used, viz: The regular tri-daily weather charts, containing the data of simultaneous observations taken at 124 Signal Service stations and 12 Canadian stations, as telegraphed to this office; monthly journals and means, 137, and 140, respectively, from the former; reports from 37 sunset stations; 223 monthly registers from voluntary observers; 43 monthly registers from United States Army post surgeons; marine records; international simultaneous observations; monthly reports from voluntary observers in, and the local weather service of, the State of Missouri; reliable newspaper extracts; special reports.

BAROMETRIC PRESSURE.

Upon chart No. II is shown by the isobaric lines the general distribution of atmospheric pressure, as reduced to sea-level, for the month.

The local barometric ranges have varied as follows: Pacific Coast, 0.50 at Roseburg to 0.22 at San Diego; Western Plateau, 0.41 at Virginia City to 0.24 at Boise City; Rocky Mountains, 0.33 at Denver to 0.26 at Santa Fé; summit of Pike's Peak, 0.30; Gulf

States, 0.41 at Montgomery to 0.22 at Punta Rassa and Key West; Atlantic States, 0.78 at New York city to 0.43 at Jacksonville; summit of Mount Washington, 0.63; Ohio Valley and Tennessee, 0.62 at Pittsburg to 0.38 at Cairo; Lake Region, 0.79 at Rochester to 0.60 at Chicago; Northwest and Eastern Rocky Mountain Slope, 0.69 at Pembina to 0.40 at Deadwood and Leavenworth.

Areas of high barometer.—Of these, three have been sufficiently marked to merit a description.
